Report on the Lower Bear Sluicegate Actuator Failure

June 2, 2012

5:10AM Babar Khan, Operations Manager for Regional Power logged in remotely into Lower Bear plant computer HMI and noticed that sluice gate was opened at 14%, headpond elevation to be at 178.33m and plant output at 4MW with available flow of 11cms. The sluice gate was stuck open at 14% and non responsive.

5:18AM Babar Khan wrote an email to BHLP Operations Team and Renton Dooley of TRP notifying them of a possible issue with sluice gate and requesting assistance requested them to try to reset the gate from the local panel.

11:45 James Florance & Christopher Reed (BHLP Operations Team) arrived at Lower Bear intake. After inspecting the condition of the sluice gate and actuator, it was determined that there were no visual indications of a physical problem that would impede the normal operation of the gate. The gate was found to be at an open position of 14%. The gate control was switched from Remote to Local operation and several attempts were made to lower the gate. There was no movement of sluice gate after 5 attempts of closing it. An attempt to raise the gate was made and it was found that it would open about by about 1% and stall.

12:00 An attempt was made to manually turn the wheel on the actuator, but it was very difficult to achieve any movement whatsoever.

12:15 A TRP employee stopped to assist and mentioned that he was able to open and close the gate earlier in the day as he had seen debris stuck under the gate, however at the time of writing this incident report, we are not aware of what if any changes that individual made to the gate settings or how this was achieved.

12:30 TRP then tried to close the gate using the local controls on the actuator and the gate fell from approximately 15% to full close. Coils of metal could be seen on the threaded rod indicating that the threads had been stripped from actuator. Some water / oil was noticed dripping from the actuator for a moment after the incident.

12:45 Actions were taken to fully open the Instream Flow Release gate and the Flushing gate to 100% in order to prevent a high headpond trip and deflation of the rubber dam.

Figure 1: Actuator Nameplate

Figure 2: Coils of metal found after failure

Figure 3: Gateshaft. (some water was observed flowing down the shaft from the actuator)

Subject:	RE: April 2 incident at Upper Mamquam
Date:	Tuesday, April 3, 2012 1:22:29 PM

Scott, TransAlta will likely say they are not the cause of the incident, but in fact, Vince and I think they are. When the trees took out the powerline, the facility opened the bypass valve, but only 10%. Hence, stage stayed depressed for about an hour. I suspect there would have been fish stranding. We are interested to see how Trans describes the event to you, and how they see their share of the responsibility. It does not appear that they conducted a search for stranded or dead fish.

Subject: April 2 incident at Upper Mamquam

Glenn/Christine,

It is my understanding that a ramping incident occurred yesterday (April 2) at the Upper Mamquam facility in the reach immediately downstream of your facility.

It is also my understanding that Transalta is obligated to monitor for non-compliances in IFR or ramping rates at the Upper Mamquam facility, and execute a series of mitigative prescriptions in the event of such non-compliance (e.g. inform agencies within 24 hours, complete impact assessment & fish salvage if required, etc).

So: please confirm if this incident has been deemed an operational (ie. ramping rate) non-compliance, and if so, have the mitigative actions been completed? I've not seen any communications from Transalta on the issue.

Thanks, Scott

---

Thanks Jenn.

So: I assume your reference to 'our discussions with compliance monitoring' refers to our meeting last week?

I appreciate that this document has been sent to the Skookum proponent, but I still don't understand why Upper Bear received its LCC in the absence of the requirements outlined in your April 2 2012 email (see attachment).

Scott

Thanks Scott.
I have attached our LTC – Process document we frequently hand out to IPPs at the start of a project. I had updated it to include our discussions with compliance monitoring during commissioning prior to sending to Skookum Creek. So, they are aware of the requirements as the get close to commissioning. If you have any comments, please let me know so I can incorporate them.
Thanks.

Jim,

As a number of projects are close to or have entered into the commissioning phase, we are looking for your direction on what the role of the IE is during the period of first diversion until the project receives it's Leave to Commence Operations from FLNRO. Our current understanding of our role has been to ensure that the installed equipment has been installed and capable of complying with both IFRs and ramping rates as outlined in the CWL. We have NOT monitored or reviewed any data that ensures the project is in compliance with these values. Since the commissioning period can be up to a year long, non-compliance events could frequently occur.

We believe the following would provide more structure during the commissioning period and would provide more assurance of compliance for FLRNO:

- The owner shall have the instream monitoring in place and operational prior to the diversion of water. The monitor placements shall be approved by the IEM and FLRNO.
- Proven calibration of the instream gauges with in-pipe / plant gauges will be required prior to the demobilization of the instream gauges. I.e. the IFR pipe flow meter measures the flow through the pipe, but does not take into account any flows that go to groundwater. IFR is the flow "in the stream" not leaving the intake.
- The owner to submit a plan for the mitigation strategies (e.g. fish salvage), list 'risky' operational testing periods to ensure the IEM is on-site, and the notification process that follows for any non-compliance event regarding the IFR and Ramping Rate compliance as specified in the DP or SDM.
- The owner to submit weekly continuous monitoring data to the IE for review for compliance with the CWL.
- The IE and IEM will be required to continue the monitoring of the plant operations during the commissioning phase up until the owner has received the Leave to Commence Operations by which all conditions of the CWL should have been satisfied. The IE would then complete their Project Completion Report.

As these requirements are not in the guidelines, we look to your direction so that we can approach the client with this reporting requirement during the commissioning period with the following:

1. The IE will develop a typical set of reporting requirements that we would incorporate as a condition of the Leave to Construct – Commissioning (including the specific details of ramping compliance) which would remain in place throughout the commissioning period until the issuance of the Leave to Commence Operations by FLNRO.

2. In the case of the Lower Bear project which has been commissioning for a few months now, we would request information dating back to the first diversion of water. I am scheduled to be on site at Bear next Tuesday (April 10th) and would like to make them aware of this prior to that visit so we can discuss while on site.

We would like to meet for a quick review of the above sometime this week. George is in town and Wednesday near the end of the day (4pm) would work, or Thursday right after lunch. Please let us know what days/times work for you.

Subject:	RE: BHLP: Lower Bear IFR Reports (January - March 2012)
Date:	Thursday, April 19, 2012 4:35:00 PM

Hi Jenn,
Here's some quick feedback:

1. Regarding IFR: the dataset provided seems to indicate several incidents of short-term non-compliance with IFR provision.
2. Regarding ramping: although the dataset provided only includes discharge (not stage), it seems that there have several events which likely resulted in rates of stage change which exceeded the default DFO rates of stage change.

So, to answer your question: the past data (as presented) suggests several incidents of non-compliance. So, there are two issues going forward:

1. What actions are to be taken by you (as IE), the proponent and (if necessary) the SDM to ensure future compliance & mitigate any impacts associated with non-compliance;
2. How should the data be collected & presented through ongoing commissioning activities to allow incidents of non-compliance to be more readily identified & resolved?

I appreciate your efforts to get this data, and to inform/motivate the proponent to take actions to complete their commissioning activities with an aim to be in compliance...but I haven't yet seen any commitments (written?) from the proponent to complete to pre-emptively identify those commissioning activities which may be most likely to induce a non-compliance (and thus would behove them to have an IEM onsite) and to apply mitigative prescriptions like fish inspections & salvage in the event of non-compliance.

Subject: FW: BHLP: Lower Bear IFR Reports (January - March 2012)

I am in receipt of the following information from Lower Bear Creek for the period January to March 2012. They are supposed to have set up the recording of data to the appropriate time interval, but in the meantime of getting the next round of compliance data, is this satisfactory for the past data? I am actually on vacation from April 24 – May 9, so if it is something I can follow up with you after that, it would be much appreciated.

Subject: BHLP: Lower Bear IFR Reports (January - March 2012)

Hi Jen,

Attached, please find the following as discussed during our on-site meeting:

1. Lower Bear SCADA Trends – Showing IFR, Plant Flow, and Head Pond Level for the months of January, February and March 2012
    a. The spikes in IFR flow values represent signal drop, IFR gate testing and headpond related construction works.
    b. The IFR gate minimum close position is set at 40%. This ensures that gate never closes below 40% electrically and mechanically. Currently at 40%, we are passing 0.5 CMS flow after flow meter calibration. Prior to calibration, 40% IFR gate position represented roughly 0.35 CMS.
2. Lower Bear Operator Reports – Daily reports taken by Operating Staff.
3. West Park IFR Flow Test results for IFR PIPE discharge capacity and flow meter calibration.

You will note from the data that we have passed more than required flow through IFR pipe located at the Lower Bear Intake. We are awaiting IFR flow readings from Dave Bates' flow/level gauge and the comparison of readings will provide reasonable calibration of the IFR flows. Once, this calibration is completed, we will eventually discontinue the use of Dave Bates flow gauge for IFR monitoring and rely solely on the readings provided by the IFR pipe flow meter instrumentation to SCADA /HMI for reporting purposes.

Please let us know if you have any questions or concerns with regards to this submission.

Best regards,

Babar Khan, P.Eng.

Hi Celeste,

I appreciate the effort you're making to provide Aman with some guidance. However, i recommend you swing past our (Erin & myself) offices, such that we provide you with information & guidance on BT stranding risk & assessment. I don't know how much experience you've got with this issue & this species, but there are some critical species & site-specific issues that you'd be well served to learn about. The timing of emergence & a free-swimming state is essential to understand.

I'll be back in the office on Thursday; Erin returns next week. Come past & say hi.

Scott

Subject: Dolly Varden background info - Mamquam Ramping protocol

Hi Aman,
Just following up with your visit this morning.
I've quickly put together a summary of information on Dolly Varden (Salvelinus malma). This may aid you in reviewing the proposed ramping protocol for the IPP project on the Mamquam river.

I understood from the email you showed me that Scott and DFO indicated that Dolly Varden was present in the river and any ramping conducted (i.e. scheduled maintenance) should be seasonally limited (considering on the presence of sensitive life stages in the river).

I am available any time for more clarification and additional information.

Celeste

Subject: Innergex - Unplanned Variance - Stokke Creek Facility

Mr. Davies,

Please be advised that that at approximately 12:00 today (15 Mar 2012), there was an event at the Stokke Creek Hydro Facility which caused a low IFR event for approximately 3 hrs. Initial data indicates there was a slide upstream of the intake structure that caused a rapid decrease in creek flow.

A detailed report will be forwarded once all of the event data can be compiled.

Regards,

Sean McCoy, P.Eng.

Event Description

Date:	15 March 2012	Time:	12:00
Event Type:	IFR		

Background

- The IFR flow is a combination of flow through the IFR gate and Coanda screen overflow. Maintaining an overflow mitigates the risk of stranding potential downstream-moving fish on the Coanda screen.
- The facility was operating in 'flow following' mode prior to the event which enables the plant control system to automatically adjust plant flow based on the upstream creek flow.

Event

- At approximately 12:00, the upstream Stokke Creek flow dropped suddenly and unexpectedly from 1.3 cms to 0.3 cms. Refer to Figure 1.
- The Harrison Lake area experienced heavy snowfall in the weeks prior to the event. A snow slide upstream of the intake is the most probable cause of the abrupt drop in creek flow.
- The blockage cleared itself and the upstream creek flow returned to pre-event levels at 15:00 (likely as the creek worked through the slide material).

Response & Mitigation

- The plant control system identified the drop in upstream creek flow and began to down-ramp the turbine at the designated flow rate.
  - The facility is designed to down-ramp slowly (instead of an abrupt stop) to mitigate the impact of a shutdown on the creek downstream of the powerhouse.

Environmental Impact & Assessment

- The IFR decreased to ~0.12 cms from 12:00 until 15:15 and from 16:00 until 17:40 when the full IFR was restored. Refer to Figure 1.
- The impact on the creek downstream of the powerhouse due to the low flow event was dampened by the controlled down-ramp of the turbine. Refer to Figure 2.

Preventative & Corrective Measures

- Continue to monitor upstream creek flow and automatically adjust plant flow to accommodate natural events and fluctuations.
- Maintain flow through the IFR gate to approximately ¾ of the IFR to mitigate the environmental impact on the diversion reach in the event of a natural upstream event that leads to an unplanned drop in mitigation flow over the Coanda screen.

Event Description

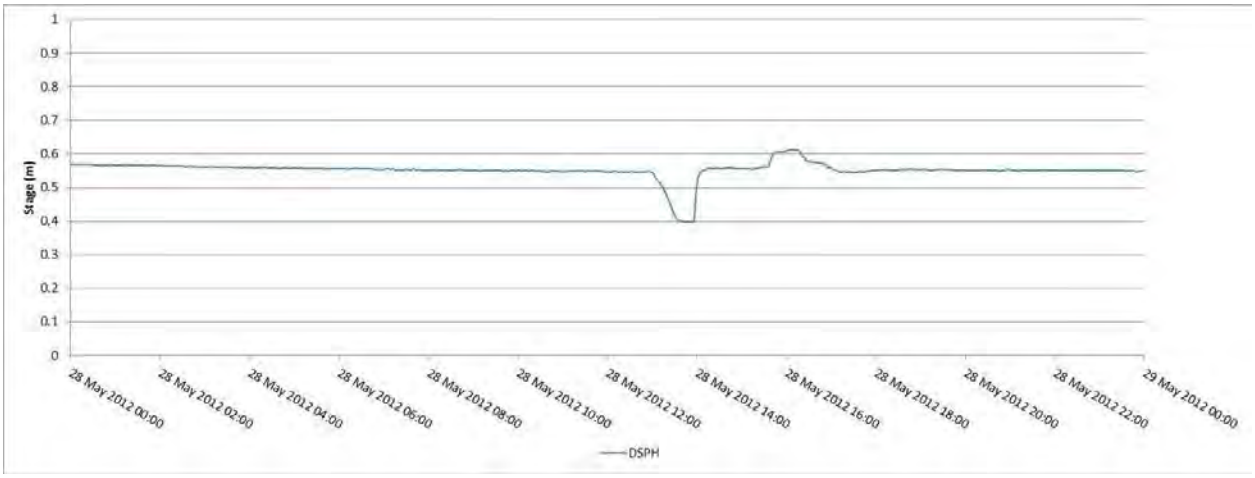
Date:	28 May 2012	Time:	13:00
Event Type:	Ramping		

- The operator was performing maintenance work in the control system building at the intake.
- There was a communication fault between the instrumentation at the intake and plant control system at the powerhouse which initiated a controlled shutdown of the generating equipment.
- During the shutdown, the maximum turbine speed set point was exceeded causing the turbine inlet valve to close.
- Closure of the turbine inlet valve resulted in a ramping event downstream of the powerhouse.

Response & Mitigation

- Ecofish Research Ltd. was dispatched to the site and conducted a stranding search at the sensitive sites.
- Communication was restored with the control system at the intake and the generating facility was restarted.

Environmental Impact & Assessment



- No stranded or distressed fish were observed during the stranding search conducted by Ecofish.
- The stage change observed downstream of the powerhouse was -0.15m (0.55 m to 0.4 m). Refer to Figure 1.

Preventative & Corrective Measures

- Optimize the maximum turbine speed set point to extend the period of time before the turbine inlet valve is closed.

Event Description

Date:	17 April 2012	Time:	15:30
Event Type:	IFR		

- The Fitzsimmons generating facility has not been operating for the majority of 2012 due to low creek flows and scheduled maintenance.
- The facility was started on 17 April 2012 to check the modifications to the intake structure and the maintenance performed on the generating equipment.
  - The instream flow briefly dropped below the minimum instream flow release during the check.

Response & Mitigation

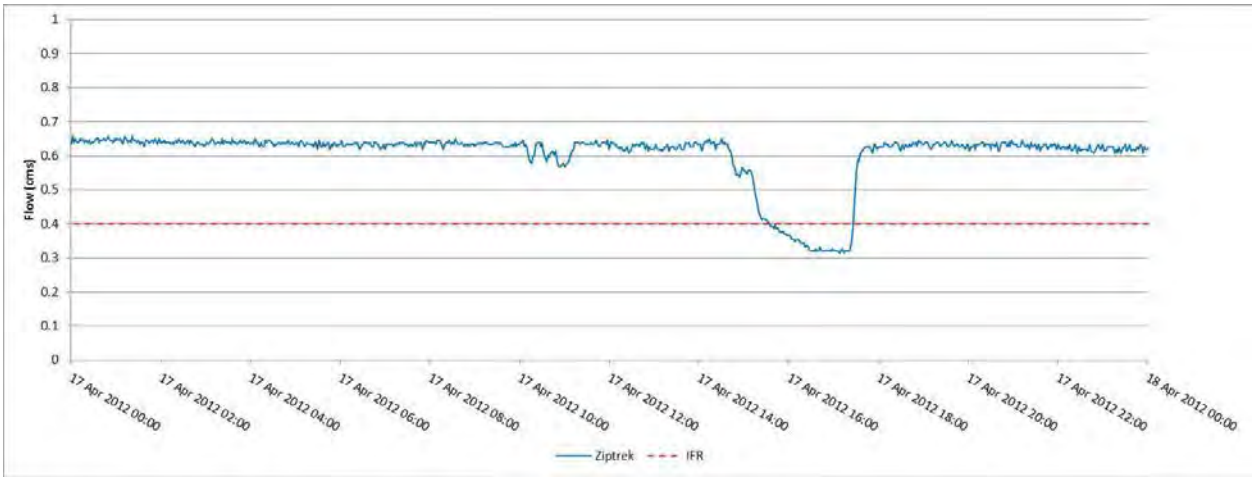
- The facility was shut down and the minimum instream flow was re-established.

Environmental Impact & Assessment

- One of the modifications to the intake structure was the addition of an engineered outlet that was designed to pass a minimum of 0.1 cms. The downstream intake gauge indicated a flow of less than 0.1 cms for approximately 75 minutes (Figure 1). The stage discharge relationship will be improved so that it more closely matches the engineered outlet flow.
- The instream flow at the Ziptrek bridge (Ziptrek) was less than 0.4 cms for approximately 60 minutes (Figure 2).

Preventative & Corrective Measures

- Improve the stage / discharge relationship at the intake and Ziptrek gauges to accurately represent the flow in Fitzsimmons Creek.



- Continue to monitor instream creek flow and adjust the plant flow accordingly.

Folks,

Two points:

1. There have been several non-compliances at Innergex facilities in recent weeks, and I was informed that detailed reports would be forthcoming, but I've yet to see any. Have they been submitted, and if not, when are they expected to be submitted?
2. It is my understanding that the 2011 OPP Compliance Reports were due for all the Innergex facilties as of March 31 2012, but I've yet to see any of these reports. Again, have they been submitted, and if not, when are they expected to be submitted?

Event Description

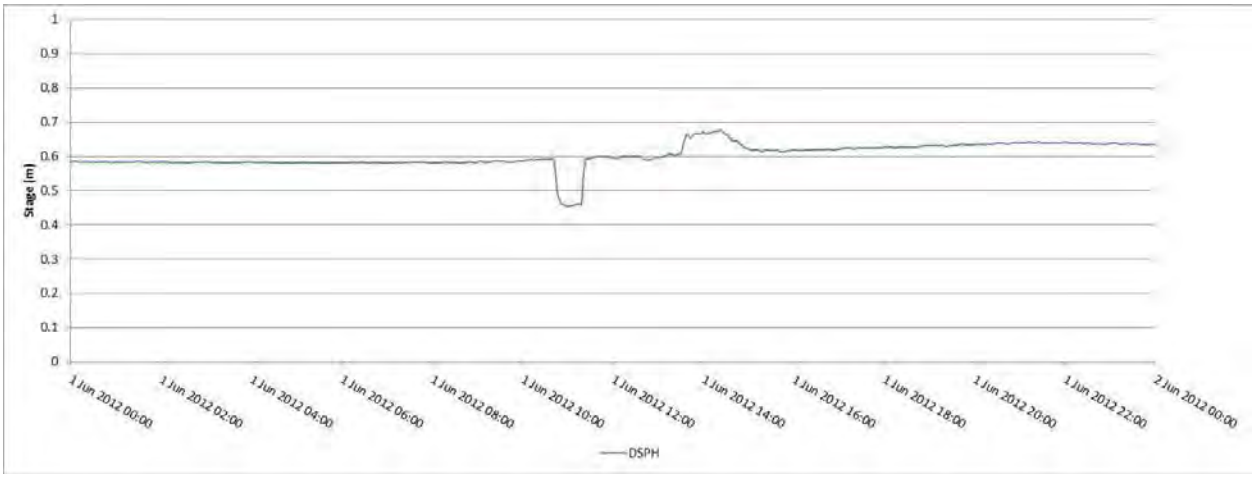
Date:	1 Jun 2012	Time:	10:45
Event Type:	Ramping		

- The generator entered an over voltage condition which initiated a controlled shutdown of the generating equipment.
- During the shutdown, the maximum turbine speed set point was exceeded causing the turbine inlet valve to close.
- Closure of the turbine inlet valve resulted in a ramping event downstream of the powerhouse.

Response & Mitigation

- Ecofish Research Ltd. was dispatched to the site and conducted a stranding search at the sensitive sites.
- An Innergex contractor logged into the plant control system to verify the generator excitation settings and the generating facility was restarted.

Environmental Impact & Assessment



- No stranded or distressed fish were observed during the stranding searches conducted by Ecofish.
- The stage change observed downstream of the powerhouse was -0.14 m (0.59 m to 0.45 m). Refer to Figure 1.

Preventative & Corrective Measures

- The maximum turbine speed set point was optimized to extend the period of time before the turbine inlet valve is closed.

Mr. Davies,

Please be advised that at approximately 23:30 on 30 March 2012 there was an unplanned shutdown of the Upper Stave facility.

A detailed report will be forwarded once all of the data has been compiled and analyzed.

Regards,
Sean McCoy

Event Description

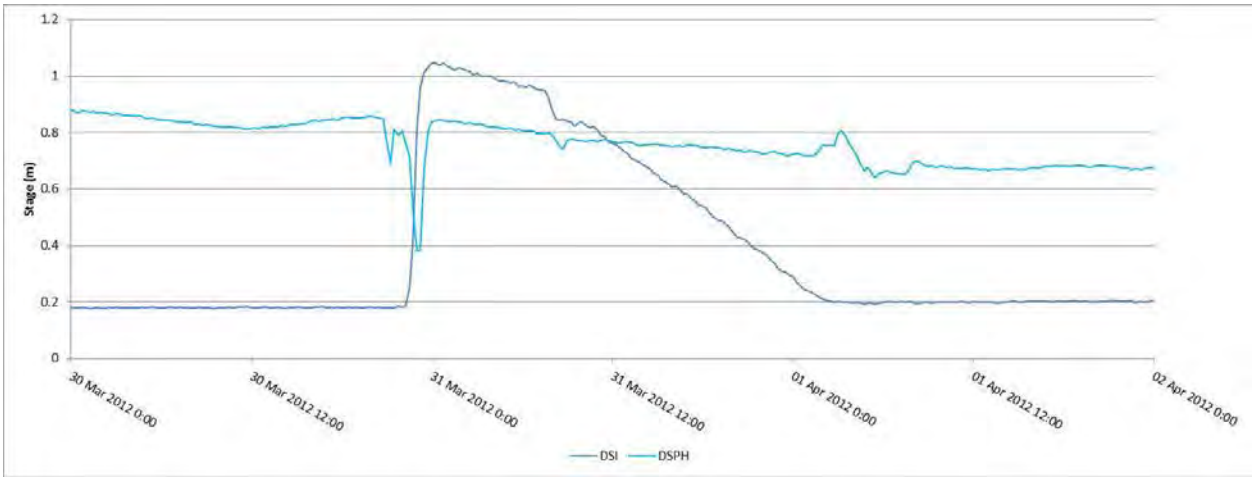
Date:	30 March 2012	Time:	21:45
Event Type:	Ramping		

- A communication fault between the generator and the plant control system caused an unplanned shutdown of the Upper Stave generating facility.
- Communication was restored shortly after the event allowing the operator to restart the generating facility.

Response & Mitigation

- The operators inspected the equipment prior to restarting the generating facility; nothing abnormal was noted.

Environmental Impact & Assessment



- The stage change observed downstream of the intake was +0.8 m. Refer to Figure 1.
- The stage change observed downstream of the powerhouse was -0.4 m for approximately two hours. Refer to Figure 1.

Preventative & Corrective Measures

- The equipment was inspected by the operators after the event; nothing abnormal was noted during the inspection.
  - The operators will continue to monitor the equipment for abnormal operation and repair as required.

Event Description

Date:	16 May 2012	Time:	16:15
Event Type:	Ramping		

- Creek flow was returning to normal after a high flow event that began two days earlier on 14 May 2012. Refer to Figure 1.
- The radial sluice gate was open during the high flow event to limit spill flow over the rubber dam.
- An operator was slowly closing the sluice gate to follow the decrease in creek flow.
- The closing rate was increased as the gate approached the fully closed position which caused a ramping event in the diversion reach.

Response & Mitigation

- Three fish stranding searchers were conducted by the Hydro Station Operators in the diversion reach.
  - Two were conducted immediately after the event; the third was conducted the next morning.

Environmental Impact & Assessment

- No stranded or distressed fish were observed during the stranding searches.
- No change in stage was observed downstream of the powerhouse. Refer to Figure 1.
- The IFR was maintained throughout the variance at greater than the 5.5 cms licence requirement. Refer to Figure 2.
- The stage change observed downstream of the intake was -0.4 m (1.2 m to 0.8 m). Refer to Figure 2.

Preventative & Corrective Measures

- Task training for the Operations Group to ensure the sluice gate closing rate is maintained throughout the closing cycle.

Subject:	Re: Lower Bear - E Stop Event - July 4th 2012 - Ramping Violation Notification
Date:	Thursday, July 5, 2012 9:01:11 AM

Hi Jen,

We had two events yesterday at Lower Bear that resulted in non-ramped closing of turbines.

At 9:40am, July 4th, 2012, the intake gate hoisting system malfunctioned and went from fully open to partially closed. The PLC sensed this changed and shut down the turbines in non ramping mode to avoid dewatering of the penstock.

The Operators were on site at the time of trip and responded to up-ramping event.

At 5:15pm, BC Hydro Line Outage sent both upper and lower into an electrical ramping trip. However, at Lower Bear, the intake gate's pre-mature closing caused a ramping violation midway through the normal shutdown of the turbines.

The Operators responded to site on this up-ramping event.

Both trips are under investigation and we have narrowed down the possible cause of intake gate related trips to UPS supplying emergency power to the system that is suppose to provide power to the intake gate on short power interruptions.

We are headed to the site this morning to confirm our diagnoses and resolve this issue as soon as possible to avoid any future unit flow ramping violations.

We will wait for Dave Bates to download the data from bypass stream and will send a complete data report. However, we should not see any ramping violation in the bypass stream as conditions in the stream with regards to spill flows were same as July 2nd trip.

If you have any questions or concerns, please let me know.

Jen et. al;

Yesterday (July 2nd 2012) at 4:15 PM, we had an e stop trip at Lower Bear Generating Station due to an issue with the main transformer oil temperature switch.

The site operators followed the draft interim compliance table. They notified FSCI Consultants and visited the site to respond to up ramping event. At the time of this trip, the spill into the bypass reach was approximately 6 CMS and we will wait for the bypass reach dataset download to confirm if there was a stream ramping violation.

It was found that under this combination of trip event and equipment operation, the logic resulted in a non ramping mode response to protect the rotating equipment. In further review, it was determined that there is not sufficient risk to equipment to justify a non ramping trip response and given this the operating logic has been modified so that future similar trip occurrences will respond with a ramped shutdown of the equipment.

Please see attached unit ramping violation data report.

Best regards,

Jen et. al;

Yesterday (July 7th 2012) at 4:21 PM, we had an e-stop trip at Lower Bear Generating Station due to an on-going issue with the main transformer oil temperature switch.

The site operators followed the draft interim compliance table. They notified FSCI Consultants and visited the site to respond to up-ramping event. At the time of this trip, the spill into the bypass reach was approximately 5 CMS and we will wait for the bypass reach dataset download to confirm if there was a stream ramping violation.

We have taken steps to bypass this device from plant protectives until we have a replacement part and will be taking extra steps tomorrow morning to ensure we have intake gate power loss issue resolved. We are regretful that this event happened again on the known issue and we will endeavour to resolve it so that it does not trip the plant in non-ramping mode. We are currently offline due to BC Hydro transmission related outage and we will have a fix in place to ensure these trips don't happen again before we go online tomorrow morning.

Best regards,

Babar Khan, P.Eng.

Attachments:	image002.png RE MQM strandaing search complete.msg

Hi Francesca,

Please see the attached Ecofish report in the accompanying email. The natural drop in river flows was approx. 2.5 cm/hr. at the river gauge When the weirs were inflated by the PLC to maintain head pond levels the ramp rate increased by another 1.7 cm\hr. as the spill was decreased. The combined decrease in flow was 4.2 cm/hr at the river gauge which equals 3 cm/hr at the stranding hot spot areas. 2 fry were found stranded and returned to the river. It is not known at this time whether the natural decline in river levels was responsible for stranding the fry, or whether the plant exasperated the situation causing the stranding. From the report it appears that there was only one slight exceedance of the 2.5cm/hr. ramping guideline

Mamquam's PLC engineers will be onsite Monday to see if the weir inflation pulses can be made in smaller steps to minimize the flow disturbance.

Hi Marc, please let us know ASAP the results of the stranding survey.Also, please let us know what time Ecofish was on site. While I hope you are correct that no fish are stranded, please keep in mind that this a particularly vulnerable time of year for fish in the river, as salmonid fry are emerging now. Can you also let us know who at Ecofish is conducting the stranded fish search?

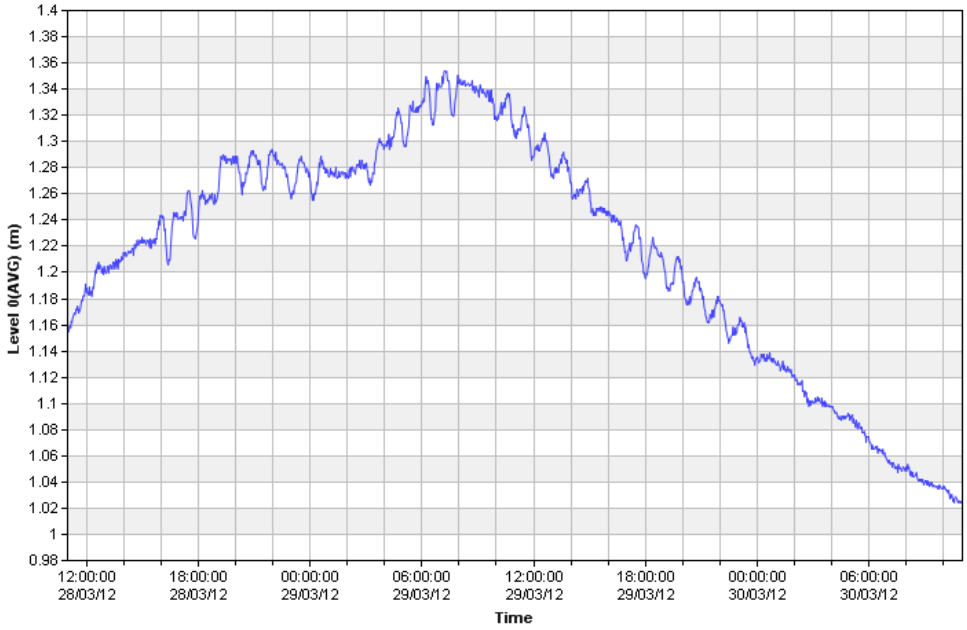
Cc: Matthew Speer; David Hermanson
Subject: Mamquam Ramping Exceedance

Hello Francesca and Vince,

Mamquam had 2-3 slight exceedances of the ramping guideline of 3.6 cm/hr (which correlates to 2.5cm/hr in the stranding hot spots). The worst exceedance was 4.1 cm/hr, which equates to approximately 2.9cm/hr in the stranding areas.



The reason for the ramping exceedance was:

- Intake pond levels started dropping due to diminishing flows
- The weirs inflated to maintain intake levels
- Spill over the intake weirs diminished due to dropping river flows

As seen in the accompanying graph, this occurred several times as the weirs inflated to maintain intake pond levels. This is the first time we have observed the weirs causing ramp rate exceedances, probably due to the high natural rate of the river flow drop. Also, normally we would have

had a second unit online so there would be no weir involvement at those flow levels (as there would be no spill), however G2 was offline for repairs.

Ecofish is conducting a stranding search and will provide a report later today or Saturday, although no fish stranding is expected. Mamquam will also work with our PLC programmers to see if the programming can be changed to allow for smaller increments of weir inflation levels.

Attachments:	image001.jpg Memo to Marc Nering re 30 Mar 2012 Ramping Incident Response Monitoring.pdf

Marc,

The memo is attached. You make some good points below. We cannot confirm that the ramping excursion did indeed isolate these fry, but it is possible. The fry were found approximately 2 m from the wetted edge, in the substrate. They were still alive because the pocket they were found in was still wet (~1 cm of water) and air temp was not freezing. This uncertainty is discussed in the memo.

We understand that you are concerned that the river may naturally be isolating or stranding fish and that these observations are being attributed to plant activities when, in fact, this may not be the case. I have discussed this briefly and Adam and we have some ideas to address this concern. We will contact you on Monday to discuss this further.

Subject: RE: MQM strandaing search complete

Ian/Dorian,

Please explain how this could occur? How did the fry survive for over 18 hours? The exceedances occurred at 16:00-22:00 yesterday.

Could they have been stranded as a result of the decrease in the natural flow rate? How close to the river's edge were they found? When was the spot the fish were found in dewatered? The plant increased the natural flow rate drop by 1.6cm/hr max, as the natural decrease in flows was 2.5cm/hr.

Thanks

Marc

Subject: RE: May 27, 2012 to June 2, 2012 Bear Monitoring Compliance Data
Date: Monday, June 18, 2012 3:48:54 PM

I was with Dave on site on June 14 where he downloaded data. He has since sent me data from the flow gauge below Morgan Creek to review. We had discussions with the operators on site last Thursday as I was upset I had not received the weekly data for the week before at that point. Regional sent me that data on Friday and I reviewed on the weekend with a number of questions. I had a discussion with Dave Bates this morning and he is going to resubmit something to me today. I will be emailing my questions to Regional tonight and am hopeful for some answers ASAP. I am out of town and cell range until Thursday, so I am trying to get this done at the end of each day via email.

I again reminded Regional that the flow chart was due June 30 and that they better not be late.

Sent: Monday, June 11, 2012 8:41 PM
To: Babakaiff, Scott C FLNR:EX; Davies, James W FLNR:EX
Cc: 'Steeves, George'
Subject: May 27, 2012 to June 2, 2012 Bear Monitoring Compliance Data

Jim and Scott,

Please find attached the compliance monitoring data as discussed along with a report and incident report of the failure of the sluice gate actuator. We (George and I) have discussed two issues with Regional upon receiving this data on Saturday June 9, 2012.

1. The ramping rate information is not included as Dave Bates is away on holidays until June 13. Upon his return the independent in-stream level measurements and ramping sections will be available and submitted by June 15th via resubmission of the report.
2. The second more alarming issue is that the graphs and data submitted indicate that they are operating Lower Bear at a plant flow rate slightly higher than their licenced flow. The weekly report reflects that the plant has been operating at 8 MW which Regional indicated is the design output that then uses a flow in excess of the licenced flow as presented on the control system. Regional indicated that Andritz is calibrating the turbines this week at the maximum plant flow which to date has only been estimated in their flow algorithm. George instructed Regional, that until this is done and vetted through Dave Bates and/or Ecofish, the maximum flow to be used as currently measured is 7.9 m3/s. and instructed Regional to take the immediate steps necessary to operate Lower Bear at or below its

licenced flow of 7.9 m3/s. Regional has confirmed today, that they will regulate flows to 7.9 m3/s using the currently uncalibrated governor flow estimate by tonight or tomorrow morning and that until the hard programmed limit is installed, they will be operating the units in flow mode such that the governor flow estimate does not indicate higher than 7.9 m3/s.

I am expecting the next set of data shortly.

Subject:	RE: Non-compliance incidents during commissioning at Bear hydropower facilities
Date:	Wednesday, June 20, 2012 6:14:24 PM

Thanks for the quick & detailed response, Jenn. I'm glad to hear that the proponent has reduced their max diversion to be in compliance with the water license!

In terms of ramping, As you've pointed out, it is difficult to determine the extent & frequency of ramping non-compliances based on the uncertainty in how a ramping rate has been calculated by the proponent; the data presented (and the gauges that data has been collected at) is not well-described in the monitoring report... but based on the near-instantaneous shut-downs & start-ups on several occasions, it seems very likely that stage change rates in excess of the allowed rates have occurred.

And I'm still somewhat stunned that no fish salvage protocol (or inspections) have been implemented since our meeting; s.22 and no progress (or alternative plans) are made by the Proponent for two weeks?

Anyhow, I'm working from home over the next few days, but feel free to call me on my cel (605-876-0006) if you'd like to chat.

Scott

Subject: RE: Non-compliance incidents during commissioning at Bear hydropower facilities

Scott,

We definitely want your input and appreciate it. We are trying to get this 'reporting' stuff correct.

I sent you the 'draft' results while awaiting pointed answers from Regional. We are still back and forth on the understanding of this data. However, you point on the exceedence of the maximum flow was addressed the very first time we saw the data and dealt with immediately. The plant flows have been cranked back as of June 12, which is not yet covered on this monitoring week. This should be shown in the week coming (which I am awaiting ASAP). In reality the plant flow during the time previous to June 12 could very well be within the flow limit and this is to be confirmed once the upper range of the testing is completed and back calculated (should be done soon). Either way, we will ensure Regional resubmits those weeks with the updated curve results used.

The ramping violation may NOT be a violation and I am confirming.....the units may in fact be sluicing water through them and ramping down that way, however that is not captured in the flows they have been submitted. Again I have posed all these questions to Regional and hope to have answers tomorrow.

-Jenn

Subject: Non-compliance incidents during commissioning at Bear hydropower facilities

OK folks,

So based on my review of the last few weekly stream flow & stage monitoring reports, commissioning activities at the Bear facilities seem to be routinely inducing ramping non-compliance events (and exceedance of maximum licensed flow diversion), but no actions seem to have been undertaken by the proponent. Then I find out that s.22 in early June, and no replacement crew was used to download data or implement mitigative prescriptions (e.g. fish salvage) in the event of non-compliance.

Careful definition of data sampling frequency & precise definition of ramping incidents are important, but I get the impression that the proponent has no sense of urgency in resolving these issues. At this point, we don't even know if these non-compliances are triggering fish stranding: no biological monitoring is ongoing. For instance, my understanding of one of the action items from our meeting with the proponent (in May) was that we (specifically the IE & SDM) was supposed to receive a schedule of 'high risk' commissioning activities, and that a fish salvage crew would be required to be onsite for these activities. As far as I know, this has not yet occurred, but commissioning (and ramping incidents) persist.

I suggest that it may be appropriate to temporarily halt flow diversion for purpose of commissioning activities until these issues are resolved to the satisfaction of the IE & SDM (e.g. implementation of adequate monitoring & mitigation plans). If anyone plans on holding the proponent to account, and you wish to have me continue providing input to this commissioning & monitoring process, please let me know. Otherwise, I'll focus my efforts elsewhere.

Scott

Subject: RE: Stage data

Thanks for update.

This is a reminder to everyone that installing a stream gauge to be used for compliance verification requires the sort of expertise & foresight that avoids having the gauge inaccessible/inoperable at high (or low) flows.

This is also a reminder as to why these gauges should've been installed & calibrated prior to commissioning, and verified as functional by the SDM prior to the leave being granted: periods of missing or inaccessible data due to flaws in equipment installation is avoidable. Moreso: it should be seen as unacceptable once diversion has begun.

Scott

Jenn

With high flows the lower stage recorder was not accessible. We are able to download today as river level is down. I'll forward on my return. The upper has been corrected. More questions for you.

---

Scott ,

I am working out of Stewart and Terrace until Thursday and have slow internet connections. My mailbox was full until now so I am not sure if some data was sent for me to review from either Dave or Regional. As SOON as I get it and my questions answered I will forward to you. In the meantime, please see the DRAFT attached information. My questions to Regional have to do with how Lower Bear sluices the water and the interval of data recording (I have requested it to be every minute).

-Jenn

Subject:	RE: Upper Mamquam - bypass valve operation notification
Date:	Tuesday, April 3, 2012 4 09:00 PM

Thanks for the response Christine.

I suggest that this event should motivate TransAlta to refine a proposal in the final sentence of Section 2.2.2 of the OPP: "In *the event of an emergency or forced outage rapid shutdown of the units, flow continuity and ramping rates will be controlled by the bypass valve*". This statement implies that operation of the bypass valve will avoid the occurrence of ramping rate non compliance; this clearly wasn't the case in yesterday's event. While TransAlta is operating in this interim period, where the downstream gauges have yet to be installed & connected to the PLC, it seems prudent to assume that any event which triggers operation of the bypass valve would result in a ramping non compliance, and would initiate the actions & mitigative prescriptions described in Section 5.1.2 of the OPP (ie. notification of MFLNRO within 24 hours, detailed report thereafter, etc.).

Scott

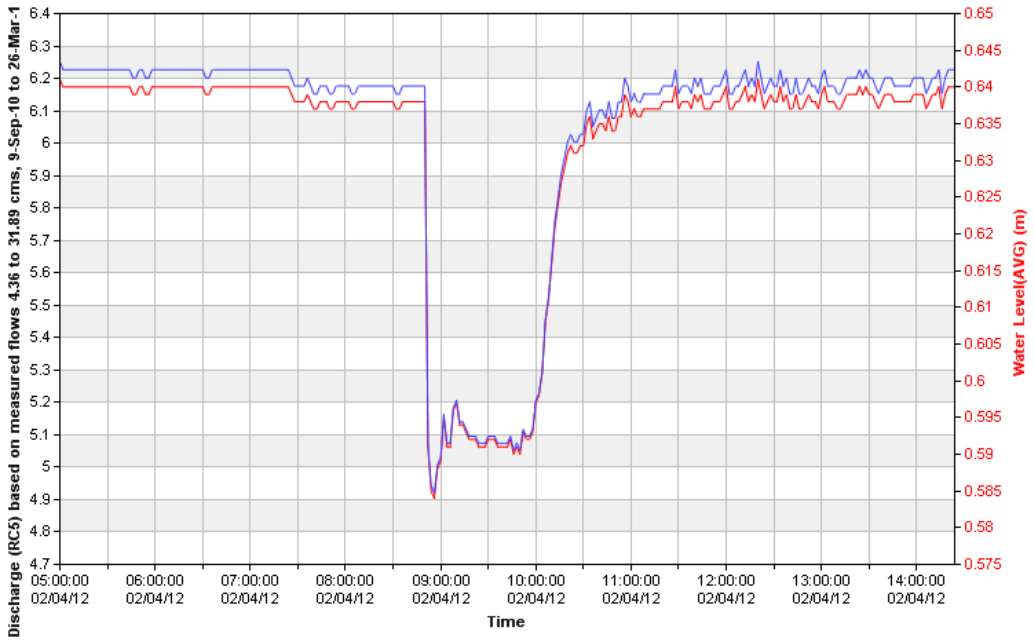
Subject: RE: Upper Mamquam bypass valve operation notification

Hello Francesca

This morning, with regards to the unscheduled bypass valve operation at the Upper Mamquam facility on Monday April 2, 2012, notification was provided by TransAlta to DFO in accordance with our OPPR Rev G, Section 5.3.3.
In response to your question regarding evaluation for potential dead or stranded fish, our operators and staff conducted an investigation of the tailrace on foot and observed no dead or stranded fish.

Section 5.1.2 of our OPPR Rev G outlines what TransAlta understands to be ramping rate non compliance. Based on the information available that was available to us this morning we did not consider the circumstances associated with the bypass valve operation to be an incident of ramping rate non compliance. Based on the new information provided, we are conducting further investigations and will provide that information as it becomes available shortly.

TransAlta is currently working to install new monitoring stations and to connect existing stations to the PLC; this process is underway and the new installations and connections have not at this time. In order to provide DFO with further information regarding this morning's bypass valve operation, TransAlta is utilizing the tools currently available to us. We are in the process of extracting data for the subject period and will be providing an update to you regarding our progress tomorrow.



Regards

Christine

Hi Christine, on this report of the unscheduled bypass valve operation, it is indicated that no dead or stranded fish were observed. Could you tell us what procedures were undertaken to evaluate the potential for dead or stranded fish?

Based on the figure below (supplied to DFO and MoE yesterday by Atlantic Power), given the stage drop and the duration of reduced water levels, it is very possible that fish were stranded below the powerhouse.

Re: Upper Mamquam Bypass Valve Operation Event on April 2, 2012

Dear Mr. Ullah;

This letter is in response to email correspondence from Scott Babakiff (MFLNRO) of April 3, 2012 at 5:10 PM, regarding the operation of the bypass valve at our Upper Mamquam facility on April 2, 2012.

On April 2, 2012 there was a logging contractor working in the area. A tree fell on a high voltage line, causing our plant to trip. Because of this trip the bypass valve at the lower end of the penstock operated to maintain flows below the plant.

When the plant tripped, penstock flows dropped from 3.6 m^3/s to 2.8 m^3/s, resulting in a drop of flow in the tailrace from 5.7 m^3/s to 4.5 m^3/s. (note there appears to be a discrepancy between the flows rate calculated by our tailrace logger and the flows calculated by the Lower Mamquam facility, both gauges record a drop of 0.05 m, however the lower plant indicates a change in flow from ~6.2 m^3/s to 5.1 m^3/s. This is a discrepancy we will attempt to address as our new loggers are installed.)

As a result of the reduced penstock flow, the headpond level increased resulting in increased flow over the weir and down the diversion channel. Approximately one hour after the event flows began rising in the tailrace and the full natural flow was passing below the plant approximately 45 minutes later.

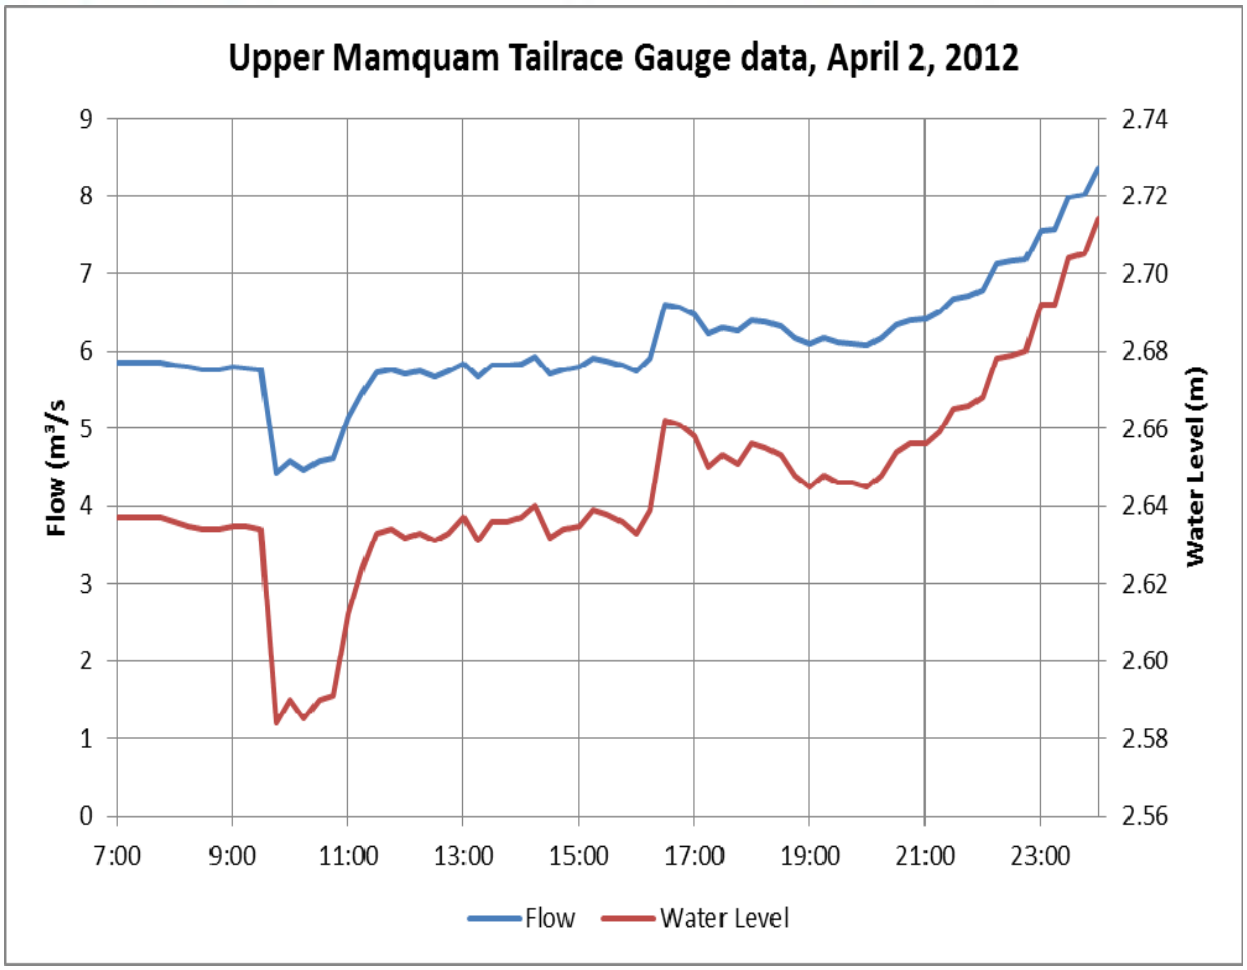
As a result of the plant trip, the water level in the river between our plant and the Lower Mamquam headpond dropped by approximately 0.05 m for this 1 hour period. This resulted in a maximum 15 minute average ramping rate of -0.2 m/h or flow ramping of (-5.3 m^3/s/h).

In exploring the plant flow data, we have identified an issue in the programming of our PLC. The PLC is programmed to always store the latest penstock flow value in memory; in the result of a unit shut down it is then designed to open the bypass valve sufficiently to maintain the last recorded flow. It appears that there is significant scatter in the instantaneous readings provided by the penstock flowmeter. In this event the last instantaneous flow reading recorded by the penstock flowmeter prior to

the trip was 2.8 m³/s and the PLC then opened the valve to this amount. In order to rectify this in the future we are adjusting the PLC logic to consider the previous 10 minute average penstock flow as the value to restore in the event of a trip. This will be implemented and tested in the next several weeks.

As you are aware, we are working in 2012 to install new monitoring stations and tie-in these and the existing stations to the PLC (Condition 5 of the Interim Leave to Operate). Once this is complete we will have additional data to guide the plant PLC. Installation of the new gauges and tie-ins to the plant are scheduled to begin April 18th, however there will need to be a testing and calibration phase before data from these new sources can be considered reliable enough to incorporate into the plant control system.

During the interim period when this work is in progress, TransAlta will initiate the actions and mitigation measures outlined in Section 5.1.2 of our OPPR Revision G, in the event of a plant trip.



I have included a plot from our tailrace logger for April 2, 2012; if you require further clarification or information please do not hesitate to contact me.

Sincerely,

Scott Taylor, P.Eng.

Subject: Upper Mamquam Incident Today

The upper Mamquam power plant tripped offline today when tree fellers logging in the area dropped a tree across their high voltage transmission lines. When their bypass opened, there was a sharp drop in river flow downstream of their plant of approx 5.5cm for one hour before returning to normal levels.

Lower Mamquam (us) attenuated the incident by drawing down the headpond level while attempting to lower unit output slowly to avoid a sudden drop in river levels. This minimized as best as possible the potential to strand fish downstream of the plant

Subject:	Upper and Lower Bear FLNRO - IE Requirements / Responsibilities (Upper File No. 2001939; Licence No. C126682) (Lower File No. 2001940; Licence No. C104330)
Date:	Monday, April 2, 2012 8:20:39 PM

Jim,

As a number of projects are close to or have entered into the commissioning phase, we are looking for your direction on what the role of the IE is during the period of first diversion until the project receives it's Leave to Commence Operations from FLNRO. Our current understanding of our role has been to ensure that the installed equipment has been installed and capable of complying with both IFRs and ramping rates as outlined in the CWL. We have NOT monitored or reviewed any data that ensures the project is in compliance with these values. Since the commissioning period can be up to a year long, non-compliance events could frequently occur.

We believe the following would provide more structure during the commissioning period and would provide more assurance of compliance for FLRNO:

- The owner shall have the instream monitoring in place and operational prior to the diversion of water. The monitor placements shall be approved by the IEM and FLRNO.
- Proven calibration of the instream gauges with in-pipe / plant gauges will be required prior to the demobilization of the instream gauges. I.e. the IFR pipe flow meter measures the flow through the pipe, but does not take into account any flows that go to groundwater. IFR is the flow "in the stream" not leaving the intake.
- The owner to submit a plan for the mitigation strategies (e.g. fish salvage), list 'risky' operational testing periods to ensure the IEM is on-site, and the notification process that follows for any non-compliance event regarding the IFR and Ramping Rate compliance as specified in the DP or SDM.
- The owner to submit weekly continuous monitoring data to the IE for review for compliance with the CWL.
- The IE and IEM will be required to continue the monitoring of the plant operations during the commissioning phase up until the owner has received the Leave to Commence Operations by which all conditions of the CWL should have been satisfied. The IE would then complete their Project Completion Report.

As these requirements are not in the guidelines, we look to your direction so that we can approach the client with this reporting requirement during the commissioning period with the following:

1. The IE will develop a typical set of reporting requirements that we would incorporate as a condition of the Leave to Construct – Commissioning (including the specific details of ramping compliance) which would remain in place throughout the commissioning period until the issuance of the Leave to Commence Operations by FLNRO.

2. In the case of the Lower Bear project which has been commissioning for a few months now, we would request information dating back to the first diversion of water. I am scheduled to be on site at Bear next Tuesday (April 10th) and would like to make them aware of this prior to that visit so we can discuss while on site.

We would like to meet for a quick review of the above sometime this week. George is in town and Wednesday near the end of the day (4pm) would work, or Thursday right after lunch. Please let us know what days/times work for you.

---

James and Scott,

Please find attached the Upper and Lower Bear compliance monitoring for the week of July 1 to 7, 2012.
There were 4 non-compliance events during this period for Lower Bear and 1 for Upper Bear. The 4 Lower Bear events did not cause any non-compliance within the stream. The 1 Upper Bear event did (see Dave Bates results). Of note, there were two other ramping violations within Upper Bear streamflow data that occurred naturally.

Dave will send you his data (or a link to it) as it is too large for me to send directly.

If you have any further questions, please do not hesitate to ask.

---

James and Scott,

Please find attached the final version of the Upper and Lower Bear compliance monitoring for the week of June 3 to 9, 2012. These attachments are from Regional. Dave Bates instream flow monitoring will follow in the next email.

My review and comments are below:

Lower Bear:

The plant flows still show above the CWL authorized flow on Lower Bear. This was cranked back immediately on June 12, 2012 when the first week highlighted this non-compliance. Further testing and calibration of the equipment will indicate if it was an actual non-compliance or just the upper end of the efficiency curves having an incorrect assumption.

There is one non-compliance event indicated on the plant flow information. It occurred when the flushing gate was stuck open, lowering the headpond level to a level that threatened air entering the penstock. There was an E stop. As this occurred during down-ramping, the critical dewatering area would normally be downstream of the tailrace. In this instance, the elevation of Clowhom Lake was high and the effects were negligible due to the event. Dave Bates has indicated that he will determine at what level Clowhom Lake will be at for down-ramping to have an effect in the area between the tailrace and the lake. Dave Bates instream monitoring downstream of the intake do not show any non-compliance events.

Upper Bear:

The Bear Lake levels are higher than the FSL level in the CWL due to the snow melt and rainfall. The weir was spilling.

It should be noted that Regional has been told that if a non-compliance event occurs and the IE, IEM and FLNRO are not notified within 24 hrs and the proper stream mitigation / investigative protocols are not completed, commissioning will be suspended until these protocols are clearly outlined and submitted to the IE, IEM and FLRNO for approval.

Chris,

Please find the attached Toba Montrose Hydro Inc.'s ramping non-compliance reports for the June 1 and 2 events at the East Toba Hydro Electric Facility (WL119308).

Thanks,

James Wilkinson - Environmental Manager
Toba Montrose General Partnership

Dear Chris:

Re: WL119308 East Toba River Hydroelectric Facility Ramping Rate Noncompliance Report #2012-ET-001

As a follow up to my email of June 1, 2012, Toba Montrose Hydro Inc. (TMHI) is submitting a more detailed account of the East Toba (WL119308) ramping rate noncompliance which occurred on June 1, 2012.

Noncompliance Reporting Requirements
Section 3 of the Operational Parameters and Procedures Report details the reporting requirements for events resulting in an emergency shutdown situation. It states that the emergency shutdown will be reported to MOE-WSD within 2 weeks of an occurrence.

Details of Incident
On June 1, a forced outage occurred at 10:50AM on Unit #1 (U1) of the East Toba Hydroelectric Facility. The flow through U1 was found to ramp down from 8.26 to 0 m^3/s in 3 minutes due to a mechanical trip caused by a deflector position sensor malfunction. This resulted in one 15 minute measurement that exceeds the ramping rate threshold of 30 cm/hr as measured in the tailrace.

Mitigation Measures
Tests completed proved that deflector 5 was working correctly, however the feedback signal was not communicating the deflector position continuously to the turbine controller which in turn initiated the trip. In conjunction with the original equipment manufacturer operational parameters the turbine controllers were changed to ensure that the loss of the feedback signal did not initiate another trip. U1 was then restarted at 6:40PM on June 1.

Fish Stranding Assessment
The down ramping of U1 resulted in a reduction in tailrace flows from 22.2 m^3/s to 14 m^3/s in 3 minutes. A flow of 14 m^3/s remained in the tailrace immediately after the trip since Unit 2 (U2) remained online. This flow was ramped up to 15.35 m^3/s over the next hour at Q/10 to maximize

the output of U2. A fish stranding assessment was performed by 2 crew members for 1 hour directly following Unit 1 shutdown (see Photo 1). No stranded fish were observed.

Photo 1: Operations technician conducting fish stranding assessment at tailrace flows of 14 m^3/s.

Sincerely,

TOBA MONTROSE HYDRO INC.

Dear Chris:

Re: WL119308 East Toba River Hydroelectric Facility Ramping Rate Noncompliance Report #2012-ET-002

As a follow up to my email of June 3, 2012, Toba Montrose Hydro Inc. (TMHI) is submitting a more detailed account of the East Toba (WL119308) ramping rate noncompliance which occurred on June 2, 2012.

Noncompliance Reporting Requirements
Section 3 of the Operational Parameters and Procedures Report details the reporting requirements for events resulting in an emergency shutdown situation. It states that the emergency shutdown will be reported to MOE-WSD within 2 weeks of an occurrence.

Details of Incident
On June 2, a forced outage occurred at 1:17AM on Unit 1 (U1) of the East Toba Hydroelectric Facility. The flow through U1 was found to ramp down from 15.35 m^3/s to 0 m^3/s in 7 minutes due to a mechanical trip caused by a nozzle positions sensor malfunction. This resulted in one 15 minute measurement that exceeded the ramping rate threshold of 40 cm/hr as measured in the tailrace.

Mitigation Measures
Tests concluded that nozzle 5 was working correctly but the feedback signal was not accurately communicating its position to the turbine controller. This feedback signal is processed by the same analogue input card that is used by deflector 5 (which failed the previous day). Therefore the analogue input card was suspected as being faulty. The nozzle was disabled in the turbine controller so that it would remain closed (out of service) until the analogue input card could be exchanged and further advice obtained from the original equipment manufacturer. The generator was restarted with 5 of the 6 nozzles in service and went online at 5:55AM on June 2.

Fish Stranding Assessment

The down ramping of U1 resulted in a reduction in tailrace flows from 30.7 m^3/s to 15.35 m^3/s in 7 minutes. A flow of 15.35 m^3/s remained in the tailrace immediately after the trip since Unit 2 remained online. A fish stranding assessment was performed by 2 crew members for 1 hour directly following U1 shutdown. No stranded fish were observed. This event happened at night so no photos were taken of the tailrace.

Sincerely,

TOBA MONTROSE HYDRO INC.

Event Description

Date:	16 May 2012	**Time:**	16:15
Event Type:	Ramping		

- Creek flow was returning to normal after a high flow event that began two days earlier on 14 May 2012. Refer to Figure 1.
- The radial sluice gate was open during the high flow event to limit spill flow over the rubber dam.
- An operator was slowly closing the sluice gate to follow the decrease in creek flow.
- The closing rate was increased as the gate approached the fully closed position which caused a ramping event in the diversion reach.

Response & Mitigation

- Three fish stranding searchers were conducted by the Hydro Station Operators in the diversion reach.
  - Two were conducted immediately after the event; the third was conducted the next morning.

Environmental Impact & Assessment

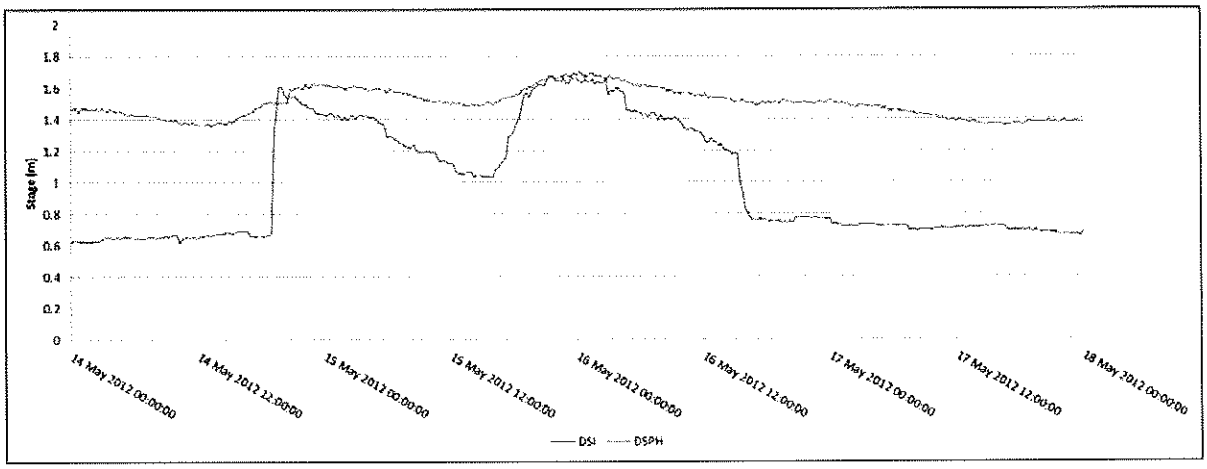
- No stranded or distressed fish were observed during the stranding searches.
- No change in stage was observed downstream of the powerhouse. Refer to Figure 1.
- The IFR was maintained throughout the variance at greater than the 5.5 cms licence requirement. Refer to Figure 2.
- The stage change observed downstream of the intake was -0.4 m (1.2 m to 0.8 m). Refer to Figure 2.

Preventative & Corrective Measures

- Task training for the Operations Group to ensure the sluice gate closing rate is maintained throughout the closing cycle.

Appendix

Figure 1: Stage Profile During High Flow Event (14 May 2012 to 18 May 2012)



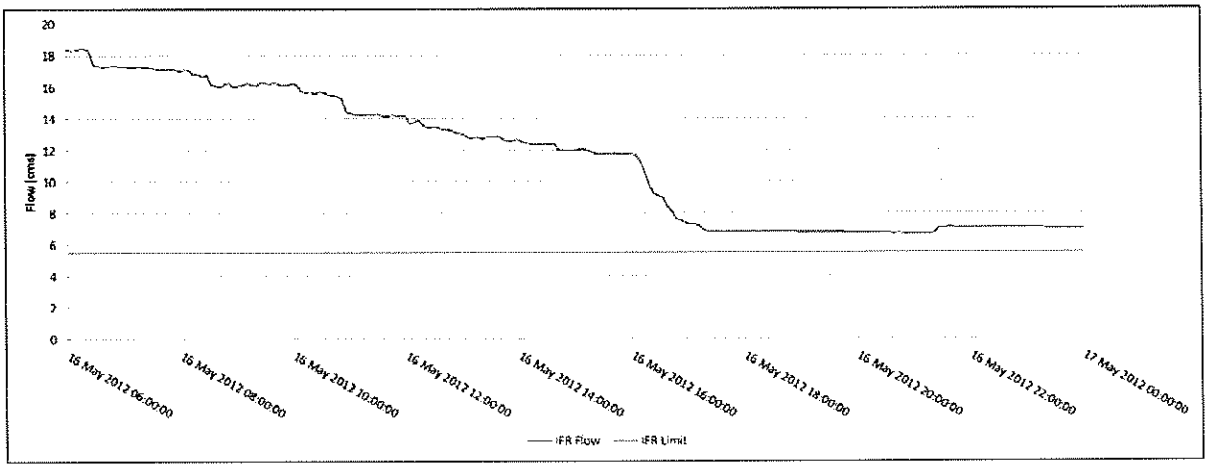


Figure 2: IFR Flow (16 May 2012)

Subject: Innergex - Unplanned Variance Event - Upper Stave

Mr. Davies,

Please be advised that on 16 May 2012 there was a ramping event at the Upper Stave generating facility.

A follow-up report will be forwarded once all the data has been compiled and analyzed.

Regards,

Sean McCoy, P.Eng.

Event Description

Date:	16 May 2012	**Time:**	16:15
Event Type:	Ramping		

- Creek flow was returning to normal after a high flow event that began two days earlier on 14 May 2012. Refer to Figure 1.
- The radial sluice gate was open during the high flow event to limit spill flow over the rubber dam.
- An operator was slowly closing the sluice gate to follow the decrease in creek flow.
- The closing rate was increased as the gate approached the fully closed position which caused a ramping event in the diversion reach.

Response & Mitigation

- Three fish stranding searchers were conducted by the Hydro Station Operators in the diversion reach.
  - Two were conducted immediately after the event; the third was conducted the next morning.

Environmental Impact & Assessment

- No stranded or distressed fish were observed during the stranding searches.
- No change in stage was observed downstream of the powerhouse. Refer to Figure 1.
- The IFR was maintained throughout the variance at greater than the 5.5 cms licence requirement. Refer to Figure 2.
- The stage change observed downstream of the intake was -0.4 m (1.2 m to 0.8 m). Refer to Figure 2.

Preventative & Corrective Measures

- Task training for the Operations Group to ensure the sluice gate closing rate is maintained throughout the closing cycle.

Appendix

Event Description

Date:	27 April 2012	**Time:**	23:00
Event Type:	IFR		

- The Upper Stave River was experiencing abnormally high flow prior to the variance event due to precipitation and warmer weather.
  - The peak instream flow was approximately 135 cms on 26 Apr 2012 @ 08:00. Refer to Figure 1.
  - The river began to naturally ramp down after the peak flow.
- During the high flow event, the IFR gate became partially obstructed due to the high volume of submerged debris which led to the IFR event when the river flow returned to normal.

Response & Mitigation

- The operator remotely opened the sluice gate to restore the IFR flow.
- The IFR gate was manually opened to dislodge the material that was causing the obstruction.

Environmental Impact & Assessment

- The instream flow release was 1.72 cms for approximately six hours, slightly less than the licenced release of 1.85 cms.
- The high flow event caused the stage to change drastically prior to the event.
  - The stage ranged from 0.2 m (prior to high flow event) to 2.9 m (peak flow) and then down to 0.17 m over a period of four days.

Preventative & Corrective Measures

- The plant control system has been modified to maintain the IFR by opening the sluice gate in the event that the IFR gate becomes partially obstructed.

Event Description

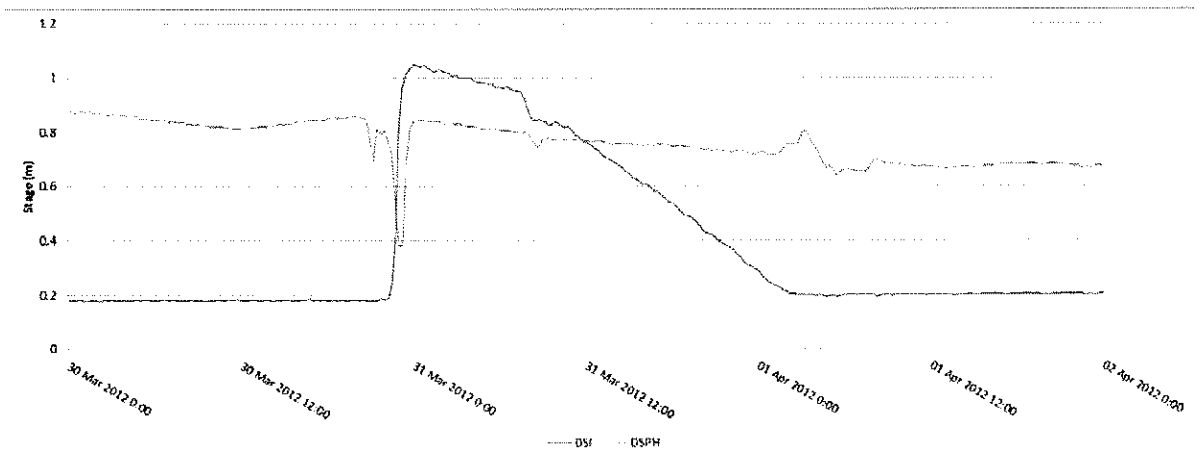
Date:	30 March 2012	**Time:**	21:45
Event Type:	Ramping		

- A communication fault between the generator and the plant control system caused an unplanned shutdown of the Upper Stave generating facility.
- Communication was restored shortly after the event allowing the operator to restart the generating facility.

Response & Mitigation

- The operators inspected the equipment prior to restarting the generating facility; nothing abnormal was noted.

Environmental Impact & Assessment



- The stage change observed downstream of the intake was +0.8 m. Refer to Figure 1.
- The stage change observed downstream of the powerhouse was -0.4 m for approximately two hours. Refer to Figure 1.

Preventative & Corrective Measures

- The equipment was inspected by the operators after the event; nothing abnormal was noted during the inspection.
  - The operators will continue to monitor the equipment for abnormal operation and repair as required.

Subject: RE: Innergex - IFR Violation at Upper Stave

Vince,

Thank you for your reply. Additional information is detailed below in response to your follow-up questions.

1. Section 3.3.3 of the OPPR addresses 'Sediment & Woody Debris Transport' but there is no specific section that addresses clearing debris from the sluice gate. The intake structure is designed to promote the movement of floating debris towards the overflow spillway. The penstock intake has a trash rack to collect floating and submerged debris to prevent damage to the turbine. The sluice gates do not have trash racks installed so that the natural bed load can be transferred downstream of the structure during periods of high flow.
2. It's difficult to say whether the debris was floating on top of the headpond or transported within the water column. I was at the intake structure approximately one hour prior to the event and can definitively say that I did not observe any debris floating on top of the headpond. It is possible that the debris that impeded flow through the sluice gate was part of the bed load and not woody.
3. The opinion by the consultant on the likely impact on fish habitat was expressed during a phone conversation with the consultant. A follow-up report is being prepared and will be forwarded when complete.
4. We are continuing to look for ways to better manage our facilities, including the passage of woody debris and improving the reliability of all systems including those designed to ensure regulatory compliance.

Regards,

Sean McCoy, P.Eng.

Sean

Thank-you for your response.

I certainly have concerns and do have more questions and a request. Debris management is in fact part of the OPPR for the facility. It is concerning from a fish habitat point of view if you believe this type of blockage of the small sluice gate is beyond Innergex's control.

I have the following questions and request:
1) Does the "Upper Stave River Parameters and Procedures Mar 2011 rev2" contain any comments and guidance with respect to clearing debris from the small sluice gate?
2) Was the debris that caused the blockage initially transported floating on top of the headpond, or was it transported within the water column?
3) Please provide the expert's analysis that you state shows that no impact to fish habitat occurred, and ask the expert to also comment on the expected impact to fish as a result of the flow reduction.

Subject: RE: Innergex - IFR Violation at Upper Stave

Vince,
Thank you for your reply.
As a follow-up to our initial report on 10 Feb 2012, please consider the following:

- The human machine interfaces (HMI) for the Stave Lake and Harrison Lake operations were designed to be interconnected to allow the operators at each site to assist each other if required. One of the operators at the

Harrison facilities selected the 'acknowledge all' button on the HMI and accidently acknowledged the Upper Stave IFR alarm. This function has since been disabled.

- An instream assessment was not conducted; the IFR decrease was detected and restored after dark which prevented the onsite personnel from safely accessing the diversion reach.
- We view any variation from our Fisheries Authorisation as a serious matter and have taken immediate steps to reduce the response time to these variations. It must be emphasised that the reduction in IFR was caused by a debris blockage outside of our control. It is the response times we continue to try and improve upon.
- Due to your concern for potential habitat destruction, Innergex consulted an expert who confirmed that this temporary reduction in flow (from 1.85 cms to 1.55 cms for 6 hrs.) would not lead to a measurable habitat destruction in the diversion reach. We acknowledge our responsibility to maintain the IFR under the Authorization but we feel that, while serious, the incident did not result in a reduction in fish habitat.

Please let me know if you have any further questions or concerns.

Regards,

Sean McCoy, P.Eng.

Sean

Thank-you for the incident report. Please consider the following.

Attached is a copy of the Fisheries Act Authorization for the Upper Stave operation. As you will see in the Authorization the minimum IFR for the months of December to April inclusive is 1.85 cubic metres per second. Within the DFO recognizes that that the flow reduction within the diversion reach is a HADD; however, the Authorization accepts some level of impact. The drop in flow that has been reported is outside of what was authorized by DFO, and is therefore an unauthorized HADD. Even within the rating system included in your report this event should be rated as a "Medium-High (Extreme)" event. Therefore my immediate concerns are twofold:

1) The unauthorized HADD that resulted in reduced flows in the diversion reach and lasted for over 6 hours
2) Innergex's reporting of the event as a "Category: Minor"

Was there any instream assessment conducted to determine what the impacts to fish were as a result of the flow reduction?

Subject: Innergex - IFR Violation at Upper Stave

Mr. Davies,
On 8 Feb 2012, there was an IFR violation at the Upper Stave facility. The IFR dropped unexpectedly at 15:33; likely due to debris partially plugging the sluice gate. The sluice gate was adjusted and the IFR was restored at 21:45.
The incident report is attached for your reference.
Regards,

Sean McCoy, P.Eng.

Subject: Innergex - Unplanned Variance Event - Upper Stave

Mr. Davies,

Please be advised that at approximately 23:30 on 30 March 2012 there was an unplanned shutdown of the Upper Stave facility.

A detailed report will be forwarded once all of the data has been compiled and analyzed.

Regards,
Sean McCoy

Subject: RE: Innergex - IFR Violation at Upper Stave

Vince,

Thank you for your reply. Additional information is detailed below in response to your follow-up questions.

1. Section 3.3.3 of the OPPR addresses 'Sediment & Woody Debris Transport' but there is no specific section that addresses clearing debris from the sluice gate. The intake structure is designed to promote the movement of floating debris towards the overflow spillway. The penstock intake has a trash rack to collect floating and submerged debris to prevent damage to the turbine. The sluice gates do not have trash racks installed so that the natural bed load can be transferred downstream of the structure during periods of high flow.
2. It's difficult to say whether the debris was floating on top of the headpond or transported within the water column. I was at the intake structure approximately one hour prior to the event and can definitively say that I did not observe any debris floating on top of the headpond. It is possible that the debris that impeded flow through the sluice gate was part of the bed load and not woody.
3. The opinion by the consultant on the likely impact on fish habitat was expressed during a phone conversation with the consultant. A follow-up report is being prepared and will be forwarded when complete.
4. We are continuing to look for ways to better manage our facilities, including the passage of woody debris and improving the reliability of all systems including those designed to ensure regulatory compliance.

Regards,

Sean McCoy, P.Eng.

Thank-you for your response.

I certainly have concerns and do have more questions and a request. Debris management is in fact part of the OPPR for the facility. It is concerning from a fish habitat point of view if you believe this type of blockage of the small sluice gate is beyond Innergex's control.

I have the following questions and request:
1) Does the "Upper Stave River Parameters and Procedures Mar 2011 rev2" contain any comments and guidance with respect to clearing debris from the small sluice gate?
2) Was the debris that caused the blockage initially transported floating on top of the headpond, or was it transported within the water column?
3) Please provide the expert's analysis that you state shows that no impact to fish habitat occurred, and ask the expert to also comment on the expected impact to fish as a result of the flow reduction.

Subject: RE: Innergex - IFR Violation at Upper Stave

Vince,
Thank you for your reply.
As a follow-up to our initial report on 10 Feb 2012, please consider the following:

- The human machine interfaces (HMI) for the Stave Lake and Harrison Lake operations were designed to be interconnected to allow the operators at each site to assist each other if required. One of the operators at the Harrison facilities selected the 'acknowledge all' button on the HMI and accidently acknowledged the Upper Stave IFR alarm. This function has since been disabled.

- An instream assessment was not conducted; the IFR decrease was detected and restored after dark which prevented the onsite personnel from safely accessing the diversion reach.
- We view any variation from our Fisheries Authorisation as a serious matter and have taken immediate steps to reduce the response time to these variations. It must be emphasised that the reduction in IFR was caused by a debris blockage outside of our control. It is the response times we continue to try and improve upon.
- Due to your concern for potential habitat destruction, Innergex consulted an expert who confirmed that this temporary reduction in flow (from 1.85 cms to 1.55 cms for 6 hrs.) would not lead to a measurable habitat destruction in the diversion reach. We acknowledge our responsibility to maintain the IFR under the Authorization but we feel that, while serious, the incident did not result in a reduction in fish habitat.

Please let me know if you have any further questions or concerns.

Regards,

Sean McCoy, P.Eng.

Thank-you for the incident report. Please consider the following.

Attached is a copy of the Fisheries Act Authorization for the Upper Stave operation. As you will see in the Authorization the minimum IFR for the months of December to April inclusive is 1.85 cubic metres per second. Within the DFO recognizes that that the flow reduction within the diversion reach is a HADD; however, the Authorization accepts some level of impact. The drop in flow that has been reported is outside of what was authorized by DFO, and is therefore an unauthorized HADD. Even within the rating system included in your report this event should be rated as a "Medium-High (Extreme)" event. Therefore my immediate concerns are twofold:

1) The unauthorized HADD that resulted in reduced flows in the diversion reach and lasted for over 6 hours
2) Innergex's reporting of the event as a "Category: Minor"

Was there any instream assessment conducted to determine what the impacts to fish were as a result of the flow reduction?

Event Description

Date:	16 May 2012	**Time:**	16:15
Event Type:	Ramping		

- Creek flow was returning to normal after a high flow event that began two days earlier on 14 May 2012. Refer to Figure 1.
- The radial sluice gate was open during the high flow event to limit spill flow over the rubber dam.
- An operator was slowly closing the sluice gate to follow the decrease in creek flow.
- The closing rate was increased as the gate approached the fully closed position which caused a ramping event in the diversion reach.

Response & Mitigation

- Three fish stranding searchers were conducted by the Hydro Station Operators in the diversion reach.
  - Two were conducted immediately after the event; the third was conducted the next morning.

Environmental Impact & Assessment

- No stranded or distressed fish were observed during the stranding searches.
- No change in stage was observed downstream of the powerhouse. Refer to Figure 1.
- The IFR was maintained throughout the variance at greater than the 5.5 cms licence requirement. Refer to Figure 2.
- The stage change observed downstream of the intake was -0.4 m (1.2 m to 0.8 m). Refer to Figure 2.

Preventative & Corrective Measures

- Task training for the Operations Group to ensure the sluice gate closing rate is maintained throughout the closing cycle.

(via email)

Re: Upper Mamquam Bypass Valve Operation Event on April 2, 2012

Dear Mr. Ullah;

This letter is in response to email correspondence from Scott Babakiff (MFLNRO) of April 3, 2012 at 5:10 PM, regarding the operation of the bypass valve at our Upper Mamquam facility on April 2, 2012.

On April 2, 2012 there was a logging contractor working in the area. A tree fell on a high voltage line, causing our plant to trip. Because of this trip the bypass valve at the lower end of the penstock operated to maintain flows below the plant.

When the plant tripped, penstock flows dropped from 3.6 m^3/s to 2.8 m^3/s, resulting in a drop of flow in the tailrace from 5.7 m^3/s to 4.5 m^3/s. (note there appears to be a discrepancy between the flows rate calculated by our tailrace logger and the flows calculated by the Lower Mamquam facility, both gauges record a drop of 0.05 m, however the lower plant indicates a change in flow from ~6.2 m^3/s to 5.1 m^3/s. This is a discrepancy we will attempt to address as our new loggers are installed.)

As a result of the reduced penstock flow, the headpond level increased resulting in increased flow over the weir and down the diversion channel. Approximately one hour after the event flows began rising in the tailrace and the full natural flow was passing below the plant approximately 45 minutes later.

As a result of the plant trip, the water level in the river between our plant and the Lower Mamquam headpond dropped by approximately 0.05 m for this 1 hour period. This resulted in a maximum 15 minute average ramping rate of -0.2 m/h or flow ramping of (-5.3 $m^3/s/h$).

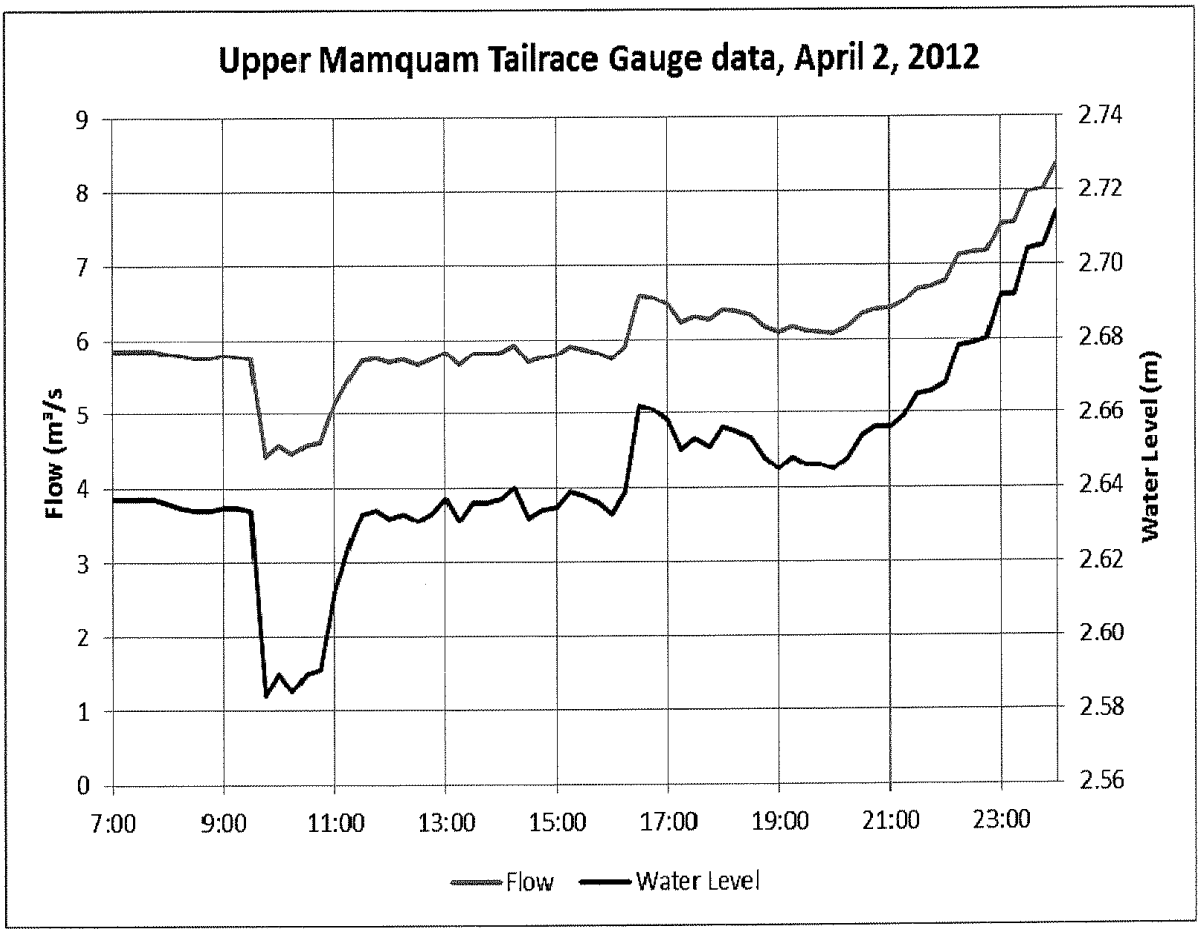
In exploring the plant flow data, we have identified an issue in the programming of our PLC. The PLC is programmed to always store the latest penstock flow value in memory; in the result of a unit shut down it is then designed to open the bypass valve sufficiently to maintain the last recorded flow. It appears that there is significant scatter in the instantaneous readings provided by the penstock flowmeter. In this event the last instantaneous flow reading recorded by the penstock flowmeter prior to

the trip was 2.8 m³/s and the PLC then opened the valve to this amount. In order to rectify this in the future we are adjusting the PLC logic to consider the previous 10 minute average penstock flow as the value to restore in the event of a trip. This will be implemented and tested in the next several weeks.

As you are aware, we are working in 2012 to install new monitoring stations and tie-in these and the existing stations to the PLC (Condition 5 of the Interim Leave to Operate). Once this is complete we will have additional data to guide the plant PLC. Installation of the new gauges and tie-ins to the plant are scheduled to begin April 18th, however there will need to be a testing and calibration phase before data from these new sources can be considered reliable enough to incorporate into the plant control system.

During the interim period when this work is in progress, TransAlta will initiate the actions and mitigation measures outlined in Section 5.1.2 of our OPPR Revision G, in the event of a plant trip.

I have included a plot from our tailrace logger for April 2, 2012; if you require further clarification or information please do not hesitate to contact me.



Sincerely,

Scott Taylor, P.Eng.

Thanks for the response Christine.

I suggest that this event should motivate TransAlta to refine a proposal in the final sentence of Section 2.2.2 of the OPP: "In *the event of an emergency or forced outage rapid shutdown of the units, flow continuity and ramping rates will be controlled by the bypass valve*". This statement implies that operation of the bypass valve will avoid the occurrence of ramping rate non-compliance; this clearly wasn't the case in yesterday's event. While TransAlta is operating in this interim period, where the downstream gauges have yet to be installed & connected to the PLC, it seems prudent to assume that any event which triggers operation of the bypass valve would result in a ramping non-compliance, and would initiate the actions & mitigative prescriptions described in Section 5.1.2 of the OPP (ie. notification of MFLNRO within 24 hours, detailed report thereafter, etc.).

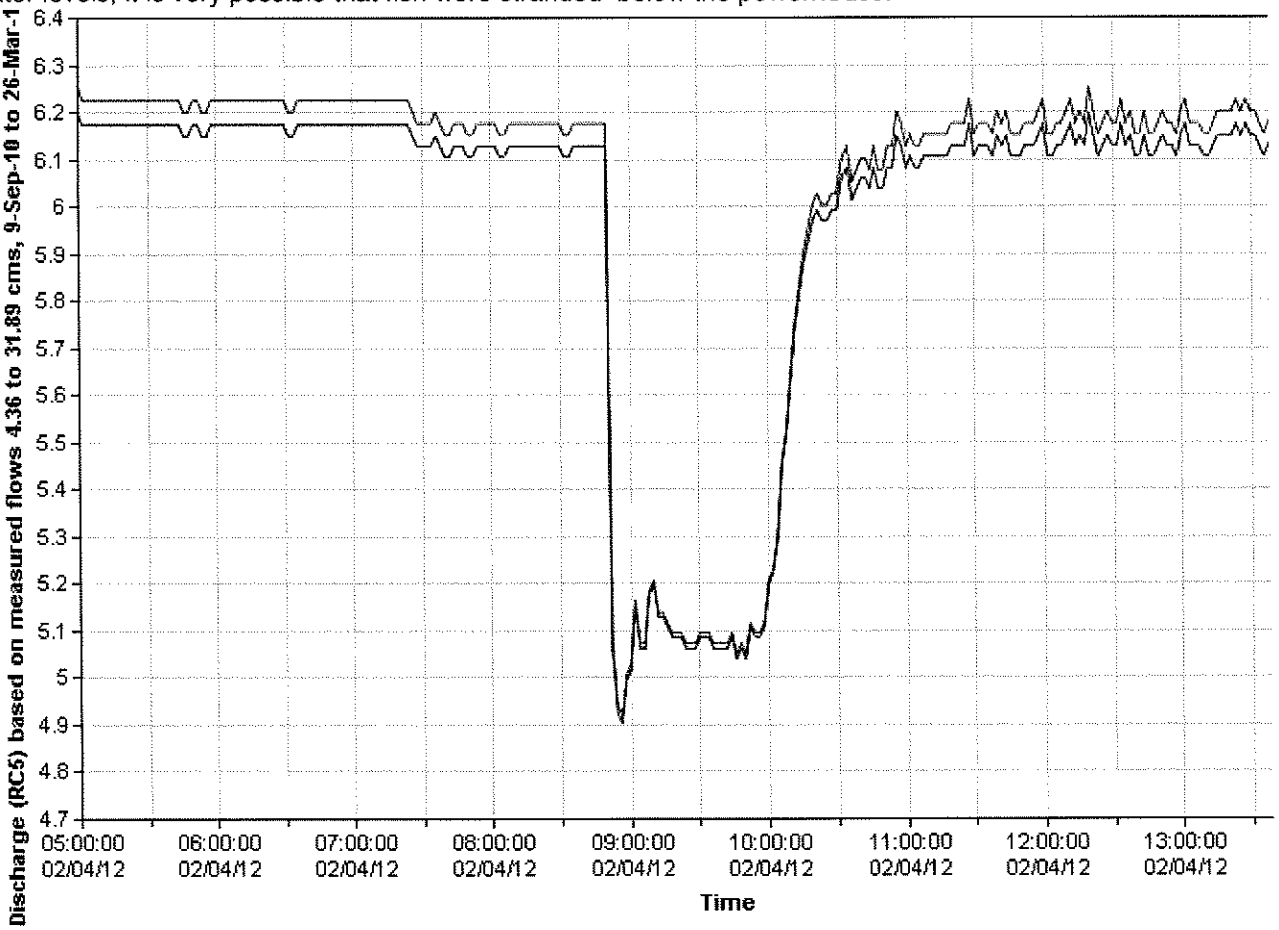
Subject: RE: Upper Mamquam - bypass valve operation notification

Hello Francesca

This morning, with regards to the unscheduled bypass valve operation at the Upper Mamquam facility on Monday April 2, 2012, notification was provided by TransAlta to DFO in accordance with our OPPR Rev G, Section 5.3.3.
In response to your question regarding evaluation for potential dead or stranded fish, our operators and staff conducted an investigation of the tailrace on foot and observed no dead or stranded fish.

Section 5.1.2 of our OPPR Rev G outlines what TransAlta understands to be ramping rate non-compliance. Based on the information available that was available to us this morning we did not consider the circumstances associated with the bypass valve operation to be an incident of ramping rate non-compliance. Based on the new information provided, we are conducting further investigations and will provide that information as it becomes available shortly.

TransAlta is currently working to install new monitoring stations and to connect existing stations to the PLC; this process is underway and the new installations and connections have not at this time. In order to provide DFO with further information regarding this morning's bypass valve operation, TransAlta is utilizing the tools currently available to us. We are in the process of extracting data for the subject period and will be providing an update to you regarding our progress tomorrow.



Regards

Christine

Hi Christine, on this report of the unscheduled bypass valve operation, it is indicated that no dead or stranded fish were observed. Could you tell us what procedures were undertaken to evaluate the potential for dead or stranded fish?

Based on the figure below (supplied to DFO and MoE yesterday by Atlantic Power), given the stage drop and the duration of reduced water levels, it is very possible that fish were stranded below the powerhouse.

Subject: Upper Mamquam Incident Today

The upper Mamquam power plant tripped offline today when tree fellers logging in the area dropped a tree across their high voltage transmission lines. When their bypass opened, there was a sharp drop in river flow downstream of their plant of approx 5.5cm for one hour before returning to normal levels.

Lower Mamquam (us) attenuated the incident by drawing down the headpond level while attempting to lower unit output slowly to avoid a sudden drop in river levels. This minimized as best as possible the potential to strand fish downstream of the plant

Marc,
Thanks for the heads up. Great effort under trying circumstances. Loggers drop a spar on a high voltage line everything goes to Hades fast, so given the circumstances would hope our colleagues at the resource agencies appreciate the quick move to mitigate.
Keep your feet dry,
Charlie

Subject: April 2 incident at Upper Mamquam

Glenn/Christine,

It is my understanding that a ramping incident occurred yesterday (April 2) at the Upper Mamquam facility in the reach immediately downstream of your facility.

It is also my understanding that Transalta is obligated to monitor for non-compliances in IFR or ramping rates at the Upper Mamquam facility, and execute a series of mitigative prescriptions in the event of such non-compliance (e.g. inform agencies within 24 hours, complete impact assessment & fish salvage if required, etc).

So: please confirm if this incident has been deemed an operational (ie. ramping rate) non-compliance, and if so, have the mitigative actions been completed? I've not seen any communications from Transalta on the issue.

Thanks, Scott

Subject: Upper Mamquam Incident Today

The upper Mamquam power plant tripped offline today when tree fellers logging in the area dropped a tree across their high voltage transmission lines. When their bypass opened, there was a sharp drop in river flow downstream of their plant of approx 5.5cm for one hour before returning to normal levels.

Lower Mamquam (us) attenuated the incident by drawing down the headpond level while attempting to lower unit output slowly to avoid a sudden drop in river levels. This minimized as best as possible the potential to strand fish downstream of the plant

Marc,
Thanks for the heads up. Great effort under trying circumstances. Loggers drop a spar on a high voltage line everything goes to Hades fast, so given the circumstances would hope our colleagues at the resource agencies appreciate the quick move to mitigate.
Keep your feet dry,
Charlie

Re: Upper Mamquam Bypass Valve Operation Event on April 2, 2012

Dear Mr. Ullah;

This letter is in response to email correspondence from Scott Babakiff (MFLNRO) of April 3, 2012 at 5:10 PM, regarding the operation of the bypass valve at our Upper Mamquam facility on April 2, 2012.

On April 2, 2012 there was a logging contractor working in the area. A tree fell on a high voltage line, causing our plant to trip. Because of this trip the bypass valve at the lower end of the penstock operated to maintain flows below the plant.

When the plant tripped, penstock flows dropped from 3.6 m^3/s to 2.8 m^3/s, resulting in a drop of flow in the tailrace from 5.7 m^3/s to 4.5 m^3/s. (note there appears to be a discrepancy between the flows rate calculated by our tailrace logger and the flows calculated by the Lower Mamquam facility, both gauges record a drop of 0.05 m, however the lower plant indicates a change in flow from ~6.2 m^3/s to 5.1 m^3/s. This is a discrepancy we will attempt to address as our new loggers are installed.)

As a result of the reduced penstock flow, the headpond level increased resulting in increased flow over the weir and down the diversion channel. Approximately one hour after the event flows began rising in the tailrace and the full natural flow was passing below the plant approximately 45 minutes later.

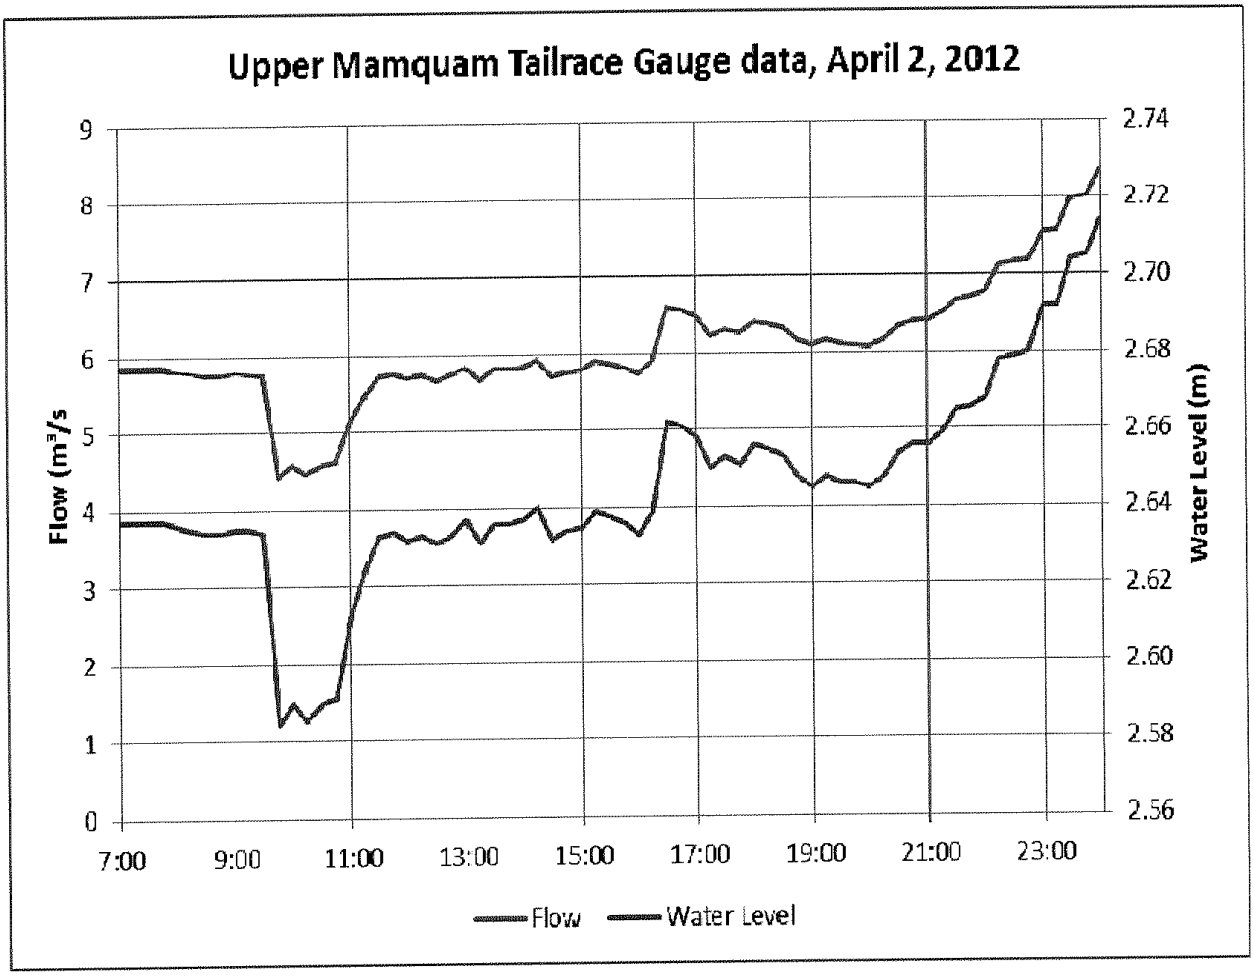
As a result of the plant trip, the water level in the river between our plant and the Lower Mamquam headpond dropped by approximately 0.05 m for this 1 hour period. This resulted in a maximum 15 minute average ramping rate of -0.2 m/h or flow ramping of (-5.3 $m^3/s/h$).

In exploring the plant flow data, we have identified an issue in the programming of our PLC. The PLC is programmed to always store the latest penstock flow value in memory; in the result of a unit shut down it is then designed to open the bypass valve sufficiently to maintain the last recorded flow. It appears that there is significant scatter in the instantaneous readings provided by the penstock flowmeter. In this event the last instantaneous flow reading recorded by the penstock flowmeter prior to

the trip was 2.8 m^3/s and the PLC then opened the valve to this amount. In order to rectify this in the future we are adjusting the PLC logic to consider the previous 10 minute average penstock flow as the value to restore in the event of a trip. This will be implemented and tested in the next several weeks.

As you are aware, we are working in 2012 to install new monitoring stations and tie-in these and the existing stations to the PLC (Condition 5 of the Interim Leave to Operate). Once this is complete we will have additional data to guide the plant PLC. Installation of the new gauges and tie-ins to the plant are scheduled to begin April 18th, however there will need to be a testing and calibration phase before data from these new sources can be considered reliable enough to incorporate into the plant control system.

During the interim period when this work is in progress, TransAlta will initiate the actions and mitigation measures outlined in Section 5.1.2 of our OPPR Revision G, in the event of a plant trip.



I have included a plot from our tailrace logger for April 2, 2012; if you require further clarification or information please do not hesitate to contact me.

Sincerely,

Scott Taylor, P.Eng.

Re: Monthly Compliance Report - Upper Mamquam Facility

Dear Mr. Davies;

The following document provides the details required under Condition 13 of TransAlta's Interim Leave To Operate related to Operations at the Upper Mamquam Hydro Electric Facility (File: 2001914).

TransAlta - Upper Mamquam Facility – Monthly Compliance Report – April 2012

Activities	Date	Explanation
Non-Compliance	N/A	• Events of non-compliance were not documented in April 2012.
Monthly Start-ups and Shut-downs	April 2, 2012	• On April 2, 2012 there was a logging contractor working in the area. A tree fell on a high voltage line, causing our plant to trip. Because of this trip the bypass valve at the lower end of the penstock operated to maintain flows below the plant. An investigation of the event was conducted and the results were reported to the Ministry of Forestry, Lands and Natural Resource Operations on April 16th, 2012.
IFR Release Information	N/A	• Installation of the new gauges and tie-ins to the plant commenced on April 18th. TransAlta is currently in the testing and calibration phase to

		ensure that the data from these new sources can be considered reliable enough to incorporate into the plant control system. Upon completion of the testing and calibration stage data will be provided to the Ministry of Forestry, Lands and Natural Resource Operations on a monthly basis as required in the Extension to the Interim Leave to Operate.
Operational revisions	April 18th, 2012	• Installation of new monitoring stations and the tie-in of the existing monitoring stations to the PLC associated with plant operations (consistent with Condition 5 of the Interim Leave to Operate) commenced on April 18th. Once this is complete we will have additional data to guide the plant PLC. • Studies related to Ramping and Instream Flow Requirements required in the Extension to the Interim Leave to Operate commenced in April 2012.

If you have any questions or require clarifications, please contact Glenn Isaac at 403-267-7273.

Sincerely,

Glenn Isaac
Manager Environmental Services - Hydro

Subject: RE: Clowhom Power - Ramping Report

Kyle,

Clowhom Power L.P is reporting us the ramping non compliances occurring off and on at the Clowhom power plants (upper & lower), thanks for that but we haven't received any information either on follow up actions to prevent these in future nor on the impacts if any resulted from these events. Even we haven't the received the completed Incident Report Form(s) despite our reminders to do so.

We are very concerned regarding these on-going non-compliances and would advise Clowhom Power to take necessary appropriate remedial measures to prevent these ramping events. Clowhom Power is once again advised to provide the completed IRFs for all the events along with a summary report for the period from ILCO issue date to end of February 2012. We would expect this by the end of this month ie. March 31, 2012.

Please contact me if you have any questions in this regard.

Regards,

Aman

Subject: Clowhom Power - Ramping Report

Aman,

On behalf of Clowhom Power L.P., I wanted to inform you of a potential ramping non-compliance at the Lower Clowhom power plant that occurred when the plant shut down due to low water. The event occurred on March 14 at 2:15 AM. The duration of the event was approximately 70 minutes, with a maximum ramping rate of 0.091 m/h at the IFR gauge compared to the target of <0.075 m/h. This was a minor flushing event at the IFR gauge. The flow ramping rate of the plant was very close to the minimum rate of -0.50 m3/s/h and only saw a maximum of about -0.53 m3/s/h.

Based on comparable past events, and the observed correlation between stage changes at the IFR gauge and sensitive location within the diversion reach, we are confident that allowable stage change within the diversion reach was not exceeded during this event. This will be verified once the logger data has been downloaded and analyzed. Nonetheless, this event remains a reportable potential non-compliance under the current interim leave to operate.

Please let us know if you have any questions.

Sincerely,

Kyle Edwards, BASc, EIT
Operations Engineer

Subject: RE: Clowhom Power - Ramping Report

Aman,

Information on follow up actions have been provided with the monthly compliance reports (I refer to our submissions dated December 15, 2011, January 11, 2012, February 15, 2012, and March 13, 2012). As you know, non-compliances are detected at stations that communicate live with the control logic, but the actual stations within the stream at its most sensitive locations to confirm compliance don't have means of live communication and have limited access. In the months where we were able to obtain this data prior to submission of the monthly compliance reports, we were able to demonstrate that the majority of ad-hoc reported non-compliances were in fact not causing a non-compliance at the sensitive locations based on the current criteria for non compliance. Based on this the statistics for the last two months are as follows:

Lower Project, January 2012
Potential non-compliances reported: 4
Confirmed non-compliances: 1

Lower Project, February 2012
Potential non-compliances reported: 4
Confirmed non-compliances: 0

Upper Project, January 2012
Potential non-compliances reported: 3
Confirmed non-compliances: 1

Upper Project, February 2012
Potential non-compliances reported: 2
Confirmed non-compliances: 0

All of the confirmed non-compliances were within 20% of the allowable limits. We believe that there is a reasonable chance that the ramping rates study schedule for summer 2012 will likely increase the allowable limits, possibly above the limits that were exceeded in recent months. This would mean that in retrospective all non-compliances for 2012 would in fact be compliant with potential new limits. This is of course speculative and should not imply that CPLP is not aiming to meet current requirements for compliance. We believe that the track record as derived from the monthly reports demonstrates that a) CPLP is diligently reporting all potential non-compliances, b) actual non-compliance events have significantly decreased down to zero in the month of February and c) the decreased numbers of potential and actual non compliances and their reduced magnitude demonstrates that the changes implemented by CPLP in recent months are having a positive impact on the operations. CPLP continues to apply significant resources to further improve the operations.

The annual report under the OEMP for 2011 is scheduled for submission in late March 2012 and will provide an assessment of the potential impacts of ramping non compliances. Please clarify what additional information with reference to the monthly compliance reports and the pending 2011 OEMP report your agency wishes to obtain in the requested summary report. If deemed beneficial, we could revise the November and December 2011 compliance reports with the now available data from the sensitive locations. The review of the data will likely reduce the number of non-compliances as it was already the case for January and February 2012.

We are available for a meeting to discuss these issues and to assure that the ministry is fully aware of all aspects of the operations.

Regards, Robert

Upper Clowhom - Monthly Compliance Report – April 2012

Dear Mr. Davies,

Please accept the following letter report, submitted in accordance with the conditions of the Interim Leave to Commence Operations dated August 4, 2011, and the subsequent extension dated December 23, 2011 for the Upper Clowhom power plant.

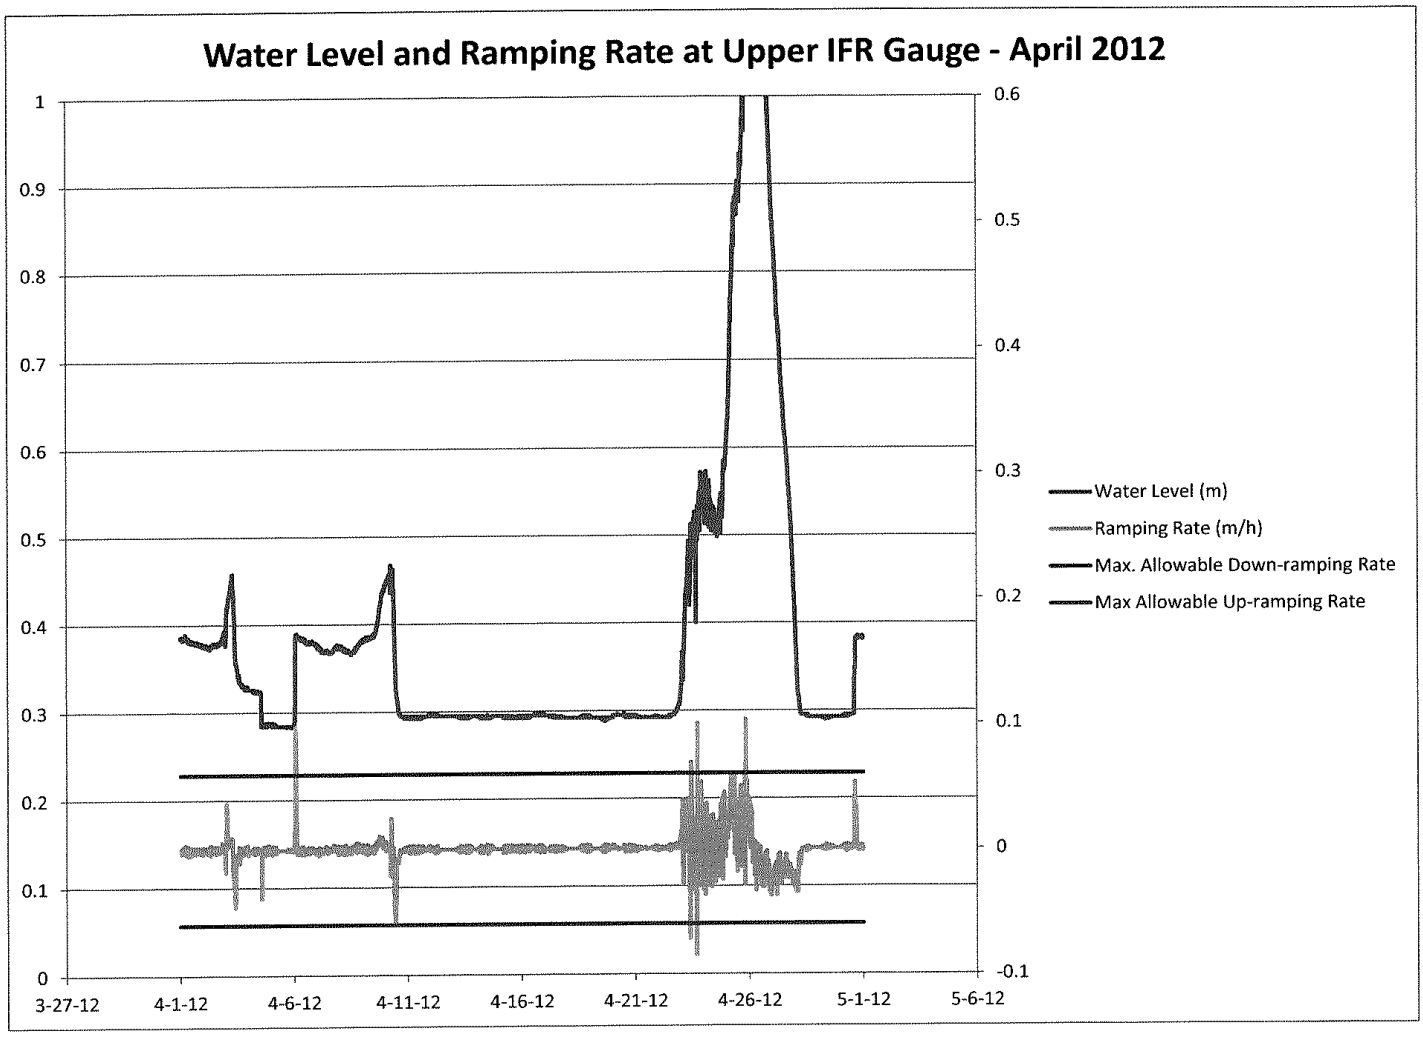
Compliance:

IFR							
Compliant							
Ramping							
Event Date/ Time	Date First Reported	Duration (h:m)	Maximum Ramping Rate* (m/h)			Cause	Conclusion
			UIFR	UDR	UDS		
4/06/12 1:25	na	0:55	0.098	na	-0.005	Weir Spill Starting	Possible ramping non-compliance to be verified with DR gauge data when available.
* The Maximum Ramping Rate column above represents the single greatest ramping rate achieved and is not a rate sustained for the duration of the event. **Data from the Upper diversion reach were not obtained for April as Via-Sat could not access the site.							

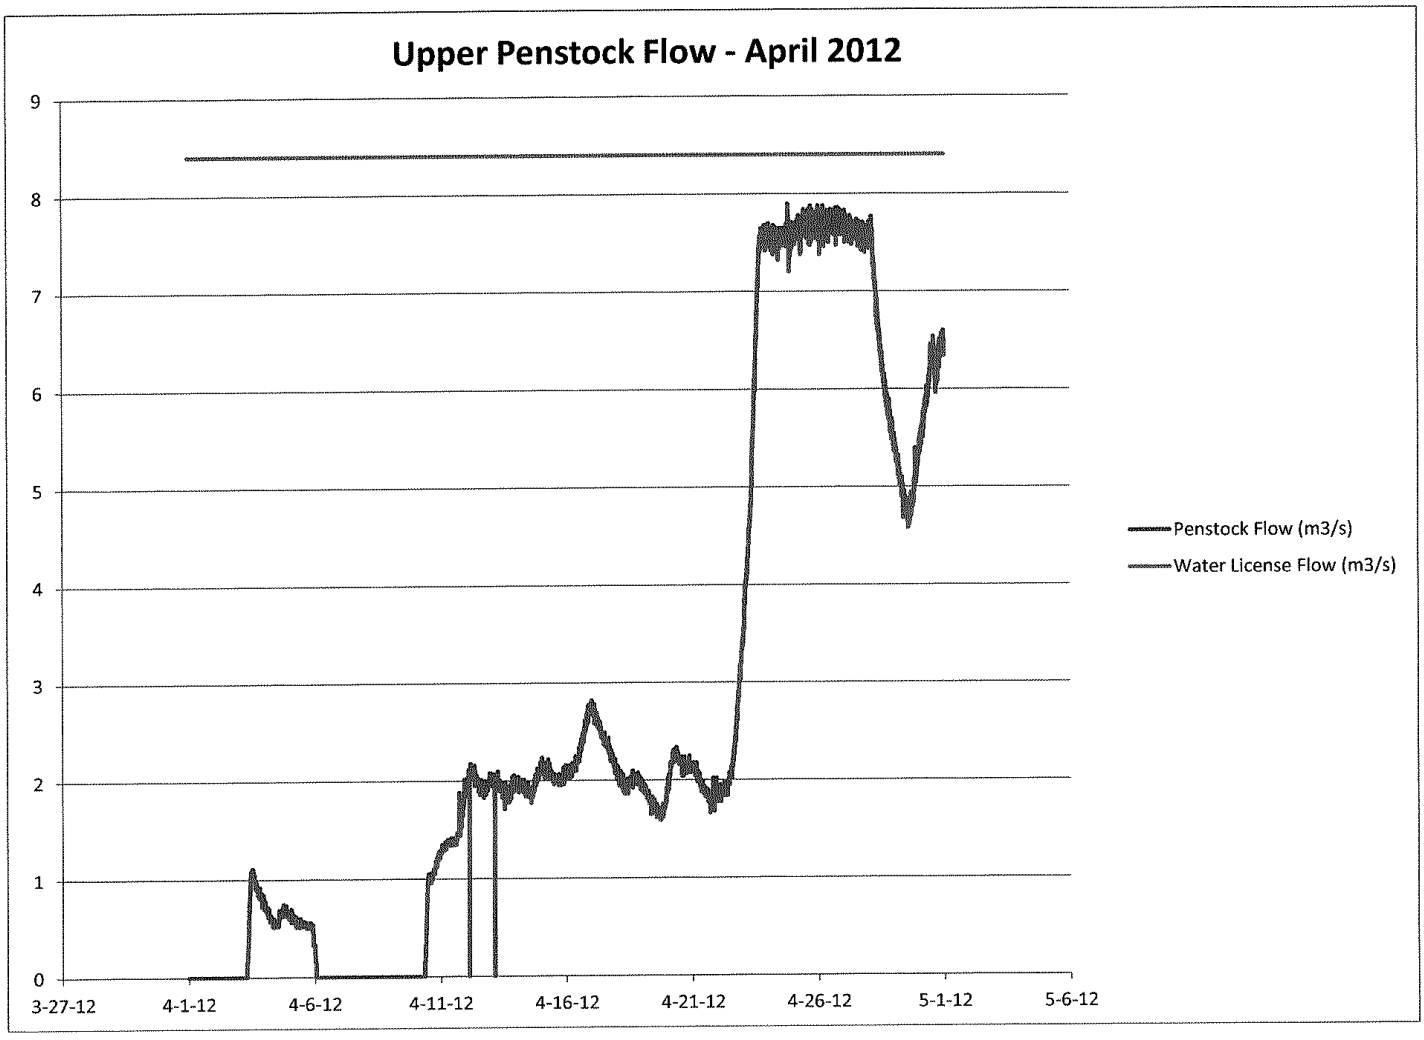
Summary of operational information:

Shutdowns/startups	Shutdown Date	Cause	Startup Date
			April 3, 2012
	April 5, 2012	Low water	April 10, 2012
	April 24, 2012	Programming glitch	April 24, 2012
Maintenance of IFR	The IFR was maintained at all times in April, with a minimum flow of 0.33 m^3/s compared to the April IFR of 0.29.		
Stage	See attached Water Level and Ramping Rate chart for five minute data at the IFR gauge.		

Diverted Flows	The maximum diverted flow was 7.90 m^3/s compared to the water license allowable diversion of 8.40 m^3/s.
Operational Changes	na



The ramping data attached consists of stage readings collected at the IFR gauge at 5 minute intervals by the plant control system HMI, and stage readings collected at the gauge downstream of the powerhouse collected by Via-Sat Data Systems. IFR Gauge data is presented in lieu of diversion reach gauge data as the logger could not be accessed for the month of April.



Sincerely,

Robert Kulka
Operations Manager
