Stokke Creek – 2002598

Davies, James W FLNR:EX

2002598

From: Ullah, Aman FLNR:EX
Sent: Friday, March 30, 2012 2:34 PM
To: Davies, James W FLNR:EX
Subject: FW: Innergex - Unplanned Variance - Stokke Creek Facility
Attachments: image001.jpg

I got it with another e-mail, so don't need it any more.

Thanks,

Aman

Mr. Davies,

The follow-up report for the low flow event at the Stokke Creek facility due to a snow slide upstream of the intake is attached for your records.

Regards,

Sean McCoy, P.Eng.

Mr. Davies,

Please be advised that that at approximately 12:00 today (15 Mar 2012), there was an event at the Stokke Creek Hydro Facility which caused a low IFR event for approximately 3 hrs. Initial data indicates there was a slide upstream of the intake structure that caused a rapid decrease in creek flow.

A detailed report will be forwarded once all of the event data can be compiled.

Regards,

Sean McCoy, P.Eng.

Mr. Davies,

The follow-up report for the low flow event at the Stokke Creek facility due to a snow slide upstream of the intake is attached for your records.

Regards,

Sean McCoy, P.Eng.

Mr. Davies,

Please be advised that that at approximately 12:00 today (15 Mar 2012), there was an event at the Stokke Creek Hydro Facility which caused a low IFR event for approximately 3 hrs. Initial data indicates there was a slide upstream of the intake structure that caused a rapid decrease in creek flow.

A detailed report will be forwarded once all of the event data can be compiled.

Regards,

Sean McCoy, P.Eng.

Event Description

Date:	15 March 2012	**Time:**	12:00
Event Type:	IFR		

Background

- The IFR flow is a combination of flow through the IFR gate and Coanda screen overflow. Maintaining an overflow mitigates the risk of stranding potential downstream-moving fish on the Coanda screen.
- The facility was operating in 'flow following' mode prior to the event which enables the plant control system to automatically adjust plant flow based on the upstream creek flow.

Event

- At approximately 12:00, the upstream Stokke Creek flow dropped suddenly and unexpectedly from 1.3 cms to 0.3 cms. Refer to Figure 1.
- The Harrison Lake area experienced heavy snowfall in the weeks prior to the event. A snow slide upstream of the intake is the most probable cause of the abrupt drop in creek flow.
- The blockage cleared itself and the upstream creek flow returned to pre-event levels at 15:00 (likely as the creek worked through the slide material).

Response & Mitigation

- The plant control system identified the drop in upstream creek flow and began to down-ramp the turbine at the designated flow rate.
  - The facility is designed to down-ramp slowly (instead of an abrupt stop) to mitigate the impact of a shutdown on the creek downstream of the powerhouse.

Environmental Impact & Assessment

- The IFR decreased to ~0.12 cms from 12:00 until 15:15 and from 16:00 until 17:40 when the full IFR was restored. Refer to Figure 1.
- The impact on the creek downstream of the powerhouse due to the low flow event was dampened by the controlled down-ramp of the turbine. Refer to Figure 2.

Preventative & Corrective Measures

- Continue to monitor upstream creek flow and automatically adjust plant flow to accommodate natural events and fluctuations.
- Maintain flow through the IFR gate to approximately ¾ of the IFR to mitigate the environmental impact on the diversion reach in the event of a natural upstream event that leads to an unplanned drop in mitigation flow over the Coanda screen.

Subject: FW: MQM strandaing search complete April 05, 2012

During the startup of G1 there was a drop in flows as G2 was ramped down to compensate for the increase in flow during the start-up of G1. There was a drop of approx. 3.6 to 4 cm (depending which gauge is used) exceeding the recommended guideline of 3.6cm/hr at the downstream of power plant river gauge. Flows were re-established quickly causing a spike upwards in river level, followed by another subsequent drop to baseline flows.

Two pink salmon fry were found dead and are being analyzed. Three fry were found alive and returned to the river (see initial report below). A detailed report from Ecofish will follow Monday.

Plant operations staff performed this operation manually to the best of their abilities using the data available, however this is a difficult operation.

This function is being automated as part of the PLC replacement project which is currently proceeding. Testing will be performed under higher freshet flows.

Subject: MQM strandaing search complete April 05, 2012

Hi Marc,

From 14:48 to 15:50 April 05, 2012, the stage at the MQM-DSLG01 dropped from 0.742 to 0.702 (-4.0cm) over 12 minutes, the 24 hr average water level was approximately 0.794. There were subsequent spike in the stage following the initial drop. This was a plant induced event that we believed warranted a fish stranding search downstream of the Lower Mamquam Hydroelectric project, especially given the sensitivity and the fact that newly emerged fry are present and most susceptible at this time of year.

The post event stranding searches are complete on the Mamquam from 19:00 to 22:30 April 05, 2012. During the searched, two stranded dead pink salmon fry and three isolated alive pink salmon fry were found under substrate on the bank near the river's edge. The dead fry were collected for analysis whereas the live fry were successfully returned to the river.

I will have a ramping incident response memo out Monday morning.

Please follow up with Adam or I if you have any further questions.

Thanks,

I do not understand how a 4 cm stage change in 12 minutes at MQM-DSL-01 results in a reported hourly stage change rate of 4cm/hr. The rate is 20 cm/hr (4cm/0.2hr), which is a very rapid stage change.

Subject: MQM strandaing search complete April 05, 2012

Hi Marc,

From 14:48 to 15:50 April 05, 2012, the stage at the MQM-DSLG01 dropped from 0.742 to 0.702 (-4.0cm) over 12 minutes, the 24 hr average water level was approximately 0.794. There were subsequent spike in the stage following the initial drop. This was a plant induced event that we believed warranted a fish stranding search downstream of the Lower Mamquam Hydroelectric project, especially given the sensitivity and the fact that newly emerged fry are present and most susceptible at this time of year.

The post event stranding searches are complete on the Mamquam from 19:00 to 22:30 April 05, 2012. During the searched, two stranded dead pink salmon fry and three isolated alive pink salmon fry were found under substrate on the bank near the river's edge. The dead fry were collected for analysis whereas the live fry were successfully returned to the river.

I will have a ramping incident response memo out Monday morning.

Please follow up with Adam or I if you have any further questions.

Thanks,

Subject: RE: Mamquam Ramping Exceedance

Hi Francesca,

Please see the attached Ecofish report in the accompanying email. The natural drop in river flows was approx. 2.5 cm/hr. at the river gauge When the weirs were inflated by the PLC to maintain head pond levels the ramp rate increased by another 1.7 cm\hr. as the spill was decreased. The combined decrease in flow was 4.2 cm/hr at the river gauge which equals 3 cm/hr at the stranding hot spot areas. 2 fry were found stranded and returned to the river. It is not known at this time whether the natural decline in river levels was responsible for stranding the fry, or whether the plant exasperated the situation causing the stranding. From the report it appears that there was only one slight exceedance of the 2.5cm/hr. ramping guideline

Mamquam's PLC engineers will be onsite Monday to see if the weir inflation pulses can be made in smaller steps to minimize the flow disturbance.

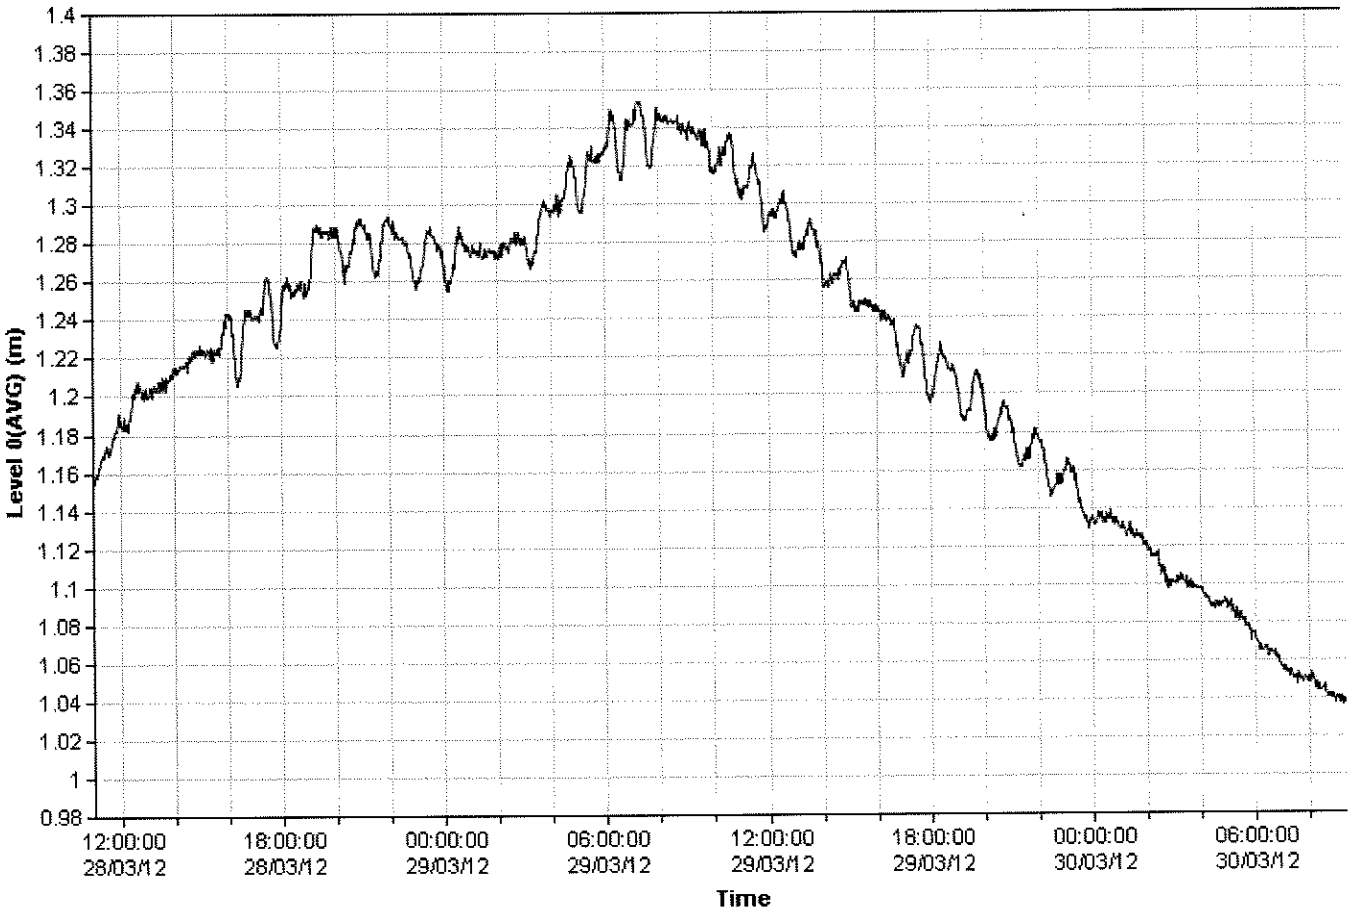
Subject: Mamquam Ramping Exceedance

Hello Francesca and Vince,



Mamquam had 2-3 slight exceedances of the ramping guideline of 3.6 cm/hr (which correlates to 2.5cm/hr in the stranding hot spots). The worst exceedance was 4.1 cm/hr, which equates to approximately 2.9cm/hr in the stranding areas.

The reason for the ramping exceedance was:

- Intake pond levels started dropping due to diminishing flows
- The weirs inflated to maintain intake levels
- Spill over the intake weirs diminished due to dropping river flows

As seen in the accompanying graph, this occurred several times as the weirs inflated to maintain intake pond levels. This is the first time we have observed the weirs causing ramp rate exceedances, probably due to the high natural rate of the river flow drop. Also, normally we would have had a second unit online so there would be no weir involvement at those flow levels (as there would be no spill), however G2 was offline for repairs.

Ecofish is conducting a stranding search and will provide a report later today or Saturday, although no fish stranding is expected. Mamquam will also work with our PLC programmers to see if the programming can be changed to allow for smaller increments of weir inflation levels.

Marc,

The memo is attached. You make some good points below. We cannot confirm that the ramping excursion did indeed isolate these fry, but it is possible. The fry were found approximately 2 m from the wetted edge, in the substrate. They were still alive because the pocket they were found in was still wet (~1 cm of water) and air temp was not freezing. This uncertainty is discussed in the memo.

We understand that you are concerned that the river may naturally be isolating or stranding fish and that these observations are being attributed to plant activities when, in fact, this may not be the case. I have discussed this briefly and Adam and we have some ideas to address this concern. We will contact you on Monday to discuss this further.

Ian/Dorian,

Please explain how this could occur? How did the fry survive for over 18 hours? The exceedances occurred at 16:00-22:00 yesterday.

Could they have been stranded as a result of the decrease in the natural flow rate? How close to the river's edge were they found? When was the spot the fish were found in dewatered? The plant increased the natural flow rate drop by 1.6cm/hr max, as the natural decrease in flows was 2.5cm/hr.

Thanks

Marc

Hi Adam,

The post event stranding searches are complete on the MQM. During the searched, two fry (salmonids ~30mm) were found alive under substrate on the bank and were successfully returned to the river. Pascale and I are currently working on the event memo and will have it sent out to Adam (cc Ian) this afternoon.

Thanks,

Dorian

ECOFISH RESEARCH

MEMORANDUM

TO:	**Marc Nering, Matt Speer**
FROM:	**Adam Lewis**
DATE:	**March 31, 2012**
FILE:	**1071-04.09**
RE:	**Lower Mamquam River - Ramping Incident Response Monitoring**

This memo describes observations made during a ramping incident response monitoring conducted for Atlantic Power Corporation (APC) on the Lower Mamquam River run-of-river hydroelectric project (the project) on March 30, 2012. Ecofish staff received an automated email alarm notification of the incident at 20:11 hrs (Pacific Daylight Time PDT - local time). The ramping event occurred at approximately 18:36 hrs. During a natural decline in river discharge following a rain event, plant weir inflation operations to adjust headpond depth resulted in water level fluctuations downstream of the plant which triggered the excursion.

In the downstream reach, there was a 4.2 cm stage reduction from 18:36 hrs to 19:00 hrs (PDT) which resulted in an hourly stage change rate at the hydrometric gauge (MQM-DSLG01) of -4.2 cm/hr (Table 1). Ramping rates were calculated following the standard protocol (Appendix A), as the difference between the current data point stage (cm) and the maximum stage in the previous hour (cm).

Time series of discharge, stage, and ramping rates as recorded at the hydrometric gauges during the events are shown for the downstream reach (Table 1).

Crews searched monitoring site MQM-DSSD02, located on either side of the Highway 99 Bridge, between 12:50 and 13:58 hrs on March 30, 2012. As discharge had been decreasing between the time of the incident and the time the search began, the crew inspected the dry steam margin adjacent to the wetted channel as well as the shallow wetted marginal areas to search for stranded fish. Two areas of 100 m (one upstream and one downstream of the bridge) were searched by four people. Broad-based searches were conducted for approximately 49 minutes for an area 8250 m^2 while hotspot, detailed searches were conducted for 85 minutes (210 m^2). No stranded or isolated fish were found, but two free swimming fry were observed at the river margin.

Crews then moved to MQM-DSSD03 downstream of Government Rd. Bridge, and were onsite from 14:06 until 14:58. Two areas of 100 m (both downstream of the bridge, one on river right, one on river left) were searched by four people. Broad-based searches were conducted for approximately 20 minutes for an area 600 m^2 while hotspot, detailed searches were conducted for 84 minutes (213.5 m^2). Two isolated salmon fry (approximately 30 mm fork length) were found on the river right bank approximately 2 m back from the wetted edge. The fry were found in a wetted pocket within the substrate, the condition of the fry was good, and they were quickly returned to the river alive.

ECOFISH RESEARCH

In summary, the Lower Mamquam project ramping excursion on the evening of March 29, 2012 exceeded the recommended 3.6 cm/hr ramping criterion, as measured at MQM-DSLG01. Ecofish crews were onsite the following day and found two isolated fry at MQM-DSSD03. It is possible that the isolation of the fry was a result of the ramping excursion. It is also possible that the fry were isolated as a result of natural stage change as river flow was naturally decreasing at that time; this cannot be confirmed. Both fry were found alive and returned to the river.

Please contact me if you have any questions or need further information.

Yours truly,
Ecofish Research Ltd.

signed

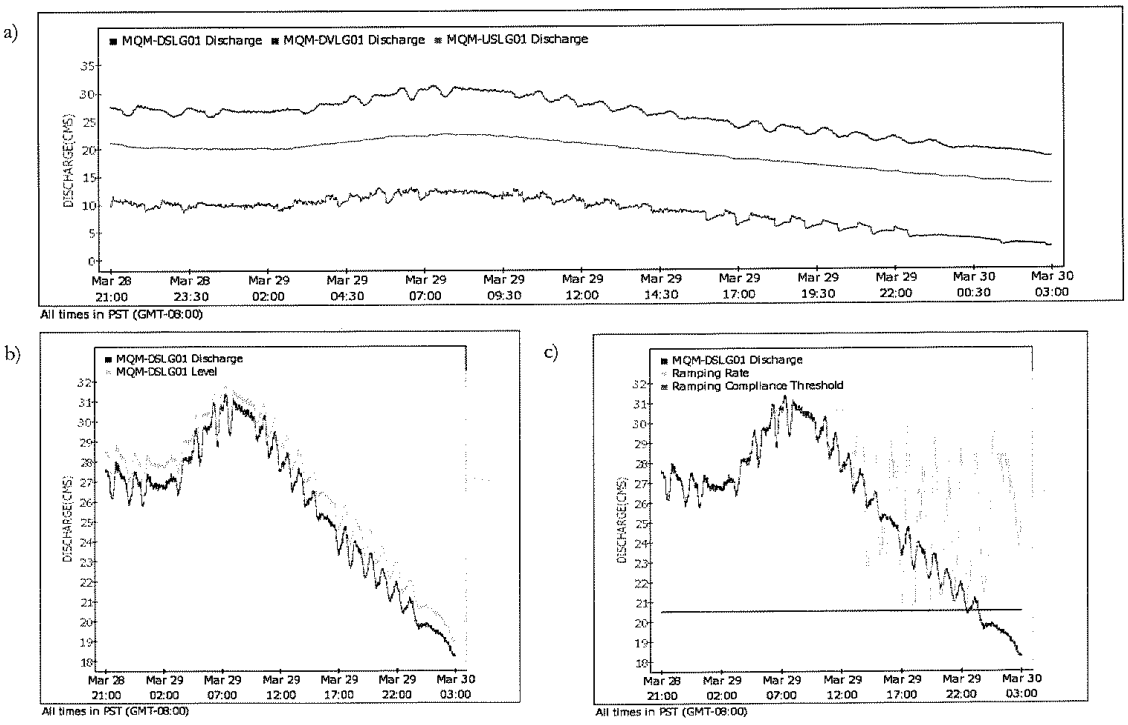
Adam Lewis, Principal

ECOFISH RESEARCH

Table 1. Summary of stage change, incident duration, and rate of change at MQM-DSLG01 during the ramping excursion on March 29, 2012.

Compliance Point	Start Time (PST)	End Time (PST)	Duration (hh:mm)	Stage Start (cm)[4]	Stage End (cm)[4]	Total Stage Change (cm)[1]	Maximum Hourly Stage Change Rate	Estimated Discharge Start (cms)[1]	Estimated Discharge End (cms)[1]
MQM-DSLG01	29-Mar-12 17:36	29-Mar-12 18:00	0hour 24min	103.7	99.5	4.2	-4.2	24.7	22.6

1 Negative number indicates stage decrease.



2 MQM-DSLG01 discharge estimated from Rating Curve 8.0 (RC8.0; Discharge = 8.336 (Stage 0.4) ^ 2.998. Discharge values are estimates.

3 This is the maximum stage change recorded within one hour at the hydrometric gauge.

4 Start and End Times denote stage decrease induced by ramping.

ECOFISH RESEARCH

Photo 2. Isolated salmon fry (~30 mm fork length) found at approximately 14:31 hrs at site MQM-DSSD03.

ECOFISH RESEARCH

Appendix A. Ramping Rate Violation Measurement

The procedure is as follows:

1. The maximum stage observed over the past hour at time ti, , should be determined for each data point according to the following equation:
   hmax(ti) = max (h(ti-k), ... , h(ti-k))

   where *h* is stage, *k* is the number of data points recorded per hour, and *t* is time, The maximum stage decrease over the past hour relative to time *i* is then defined by the equation:
   hmax(ti) = max (h(ti-k), ... , h(ti-k))

2. If the maximum stage change *hmax(ti)* exceeds the ramping criterion (e.g. -3.6 cm for MQM-DSLG01), the data are flagged as a potential ramping event. That is the exceedance rule (Rule 1).

3. A mortality event is assumed to occur if the stage remains below for a critical period, which is the dewatering time. The time to asphyxiation is assumed to be 10 minutes considering both air exposure and the time needed for the substrate to drain. This is the dewatering rule (Rule 2).

4. The average stage over some time prior to a ramping event may be used to determine the likelihood of habituation of the affected habitat (we have selected 24 hours). If the maximum level associated with the ramping exceeds the average stage from the past 24 hours, the stage change is recomputed using the 24hr average (as hmax), and violation of Rule 1 is reassessed. If the stage change based on the 24hr average does not exceed the ramping criteria, the event is not flagged as a ramping excursion.

I do not understand how a 4 cm stage change in 12 minutes at MQM-DSL-01 results in a reported hourly stage change rate of 4cm/hr. The rate is 20 cm/hr (4cm/0.2hr), which is a very rapid stage change.

ECOFISH RESEARCH

MEMORANDUM

TO: Marc Nering, Matt Speer
FROM: Adam Lewis
DATE: April 16, 2012
FILE: 1071-04.09
RE: Lower Mamquam River - Ramping Incident Response Monitoring

This memo describes observations made during a ramping incident response monitoring conducted for Atlantic Power Corporation (APC) on the Lower Mamquam River run-of-river hydroelectric project (the project) on April 05, 2012. Ecofish staff received an automated email alarm notification and confirmed a ramping incident had occurred between approximately at 14:48 and 15:00 hrs (Pacific Daylight Time PDT - local time) on April 05, 2012. It was confirmed that plant operations resulted in water level fluctuations downstream of the powerhouse which triggered the ramping incident. An overview map of the Mamquam River (Figure 1) shows the location of the project, the gauging stations, and the stranding search sites.

In the downstream reach, there was a total stage reduction of 4.0 cm from 14:48 hrs to 15:00 hrs (PDT) which resulted in an hourly stage change rate at the hydrometric gauge (MQM-DSLG01) of -4.0 cm/hr (Table 1). The river discharge at the time over the start of the event was 12.5 cms; therefore, the maximum recommended ramping rate criteria at MQM-DSLG01 used to assess the alarm was -3.6 cm/hr (Table 2), which was exceeded. The maximum ramping rate criteria of -3.6 cm/hr at MQM-DSLG01 is assumed to translate into approximately a -2.5 cm/hr ramping rate at sensitive stranding sites in the downstream reach. Ramping rates were calculated following the standard protocol (Appendix A), as the difference between the current data point stage (cm) and the maximum stage in the previous hour (cm).

Time series of discharge, stage, and ramping rates as recorded at the hydrometric gauges during the events are shown for the downstream reach (Table 1).

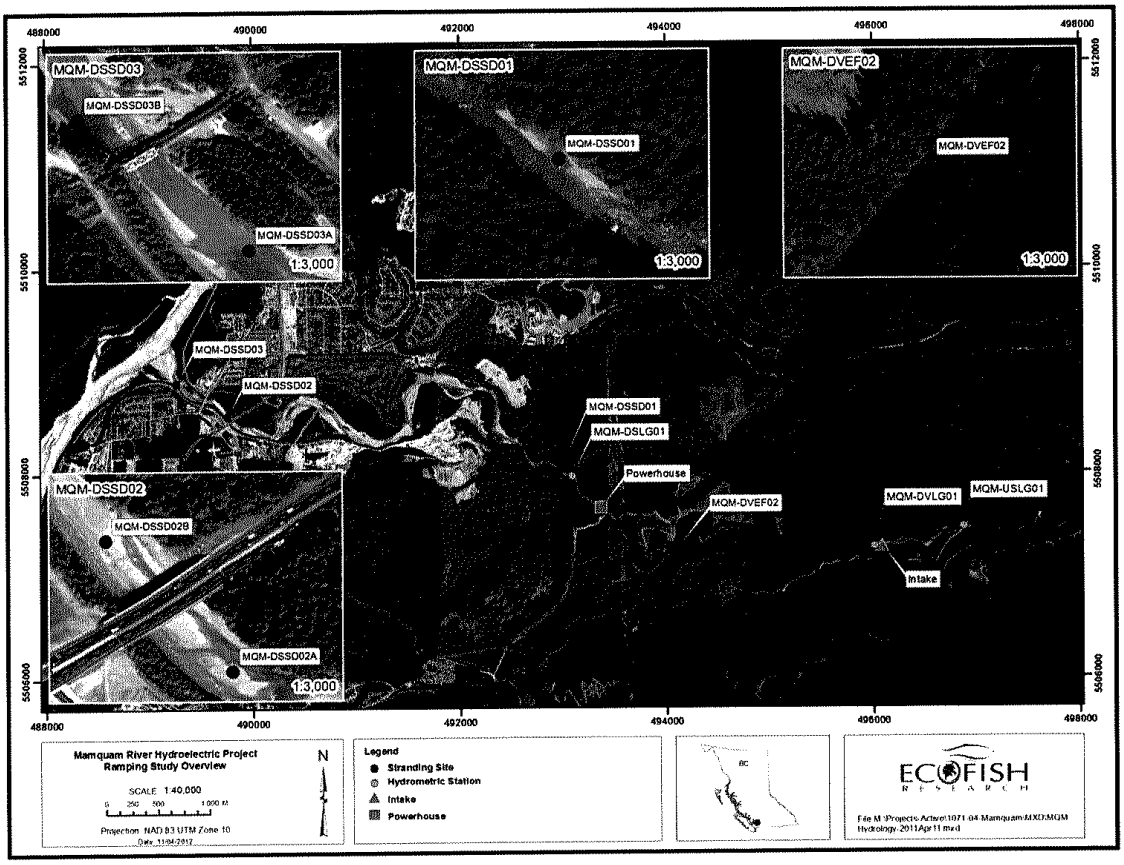
Crews searched monitoring site MQM-DSSD03 downstream of Government Rd. Bridge, and were onsite from 19:10 until 20:30 PDT on April 05, 2012. As natural river discharge had been declining between the time of the incident and the time the search began, the crew inspected the dry stream margin adjacent to the wetted channel as well as the shallow wetted marginal areas to search for stranded fish. Two stranding areas (both downstream of the bridge, one on river right, one on river left) were searched by two people. Broad-based searches were conducted for approximately 30 minutes for an area 600 m^2 while hotspot, detailed searches were conducted for 80 minutes (207 m^2). One stranded pink salmon fry (29 mm fork length) was on the river right bank. The fry was found dead under substrate above water level and approximately 0.7 m back from the wetted edge. On the river left bank, one stranded pink salmon fry (29 mm fork length) was found dead in a wetted pocket under substrate and approximately 0.4 m back from the wetted edge. The two dead fry were

collected for further analysis. In addition, three isolated pink salmon fry (~30 mm fork length) were found alive in moist pockets under substrate approximately 0.3 m back from the wetted edge, and were released back into the river in good condition.

Crews moved to monitoring site MQM-DSSD02, located on either side of the Highway 99 Bridge, between 20:45 and 21:50 hrs PDT on April 05, 2012. Search methods were similar to those used on MQM-DSSD03. Broad-based searches were conducted for approximately 32 minutes for an area 700 m^2 while hotspot, detailed searches were conducted for 80 minutes (204 m^2). No stranded or isolated fish were found.

In summary, the Lower Mamquam project ramping incident on the evening of April 05, 2012 exceeded the recommended 3.6 cm/hr ramping criterion, as measured at MQM-DSLG01. Ecofish crews were onsite that evening and found two stranded and three isolated fry at MQM-DSSD03. It is possible that the isolation and stranding of these fry was a result of the ramping excursion. It is also possible that the fry were isolated as a result of natural stage change as river flow was naturally decreasing at that time; this cannot be confirmed.

Please contact me if you have any questions or need further information.



Yours truly
Ecofish Research Ltd.

ECOFISH RESEARCH

Appendix A. Ramping Rate Violation Measurement

The procedure is as follows:

1. The maximum stage observed over the past hour at time ti, should be determined for each data point according to the following equation:

$$hmax(ti) = max\ (h(ti-k), \ldots , h(ti-k))$$

where *h* is stage, *k* is the number of data points recorded per hour, and *t* is time, The maximum stage decrease over the past hour relative to time *ti* is then defined by the equation:

$$hmax(ti) = max\ (h(ti-k), \ldots , h(ti-k))$$

2. If the maximum stage change *hmax(ti)* exceeds the ramping criterion (e.g. -3.6 cm for MQM-DSLG01), the data are flagged as a potential ramping event. That is the exceedance rule (Rule 1).

3. A mortality event is assumed to occur if the stage remains below for a critical period, which is the dewatering time. The time to asphyxiation is assumed to be 10 minutes considering both air exposure and the time needed for the substrate to drain. This is the dewatering rule (Rule 2).

4. The average stage over some time prior to a ramping event may be used to determine the likelihood of habituation of the affected habitat (we have selected 24 hours). If the maximum level associated with the ramping exceeds the average stage from the past 24 hours, the stage change is recomputed using the 24hr average (as hmax), and violation of Rule 1 is reassessed. If the stage change based on the 24hr average does not exceed the ramping criteria, the event is not flagged as a ramping excursion.

Hi Marc, please let us know ASAP the results of the stranding survey.Also, please let us know what time Ecofish was on site. While I hope you are correct that no fish are stranded, please keep in mind that this a particularly vulnerable time of year for fish in the river, as salmonid fry are emerging now. Can you also let us know who at Ecofish is conducting the stranded fish search?

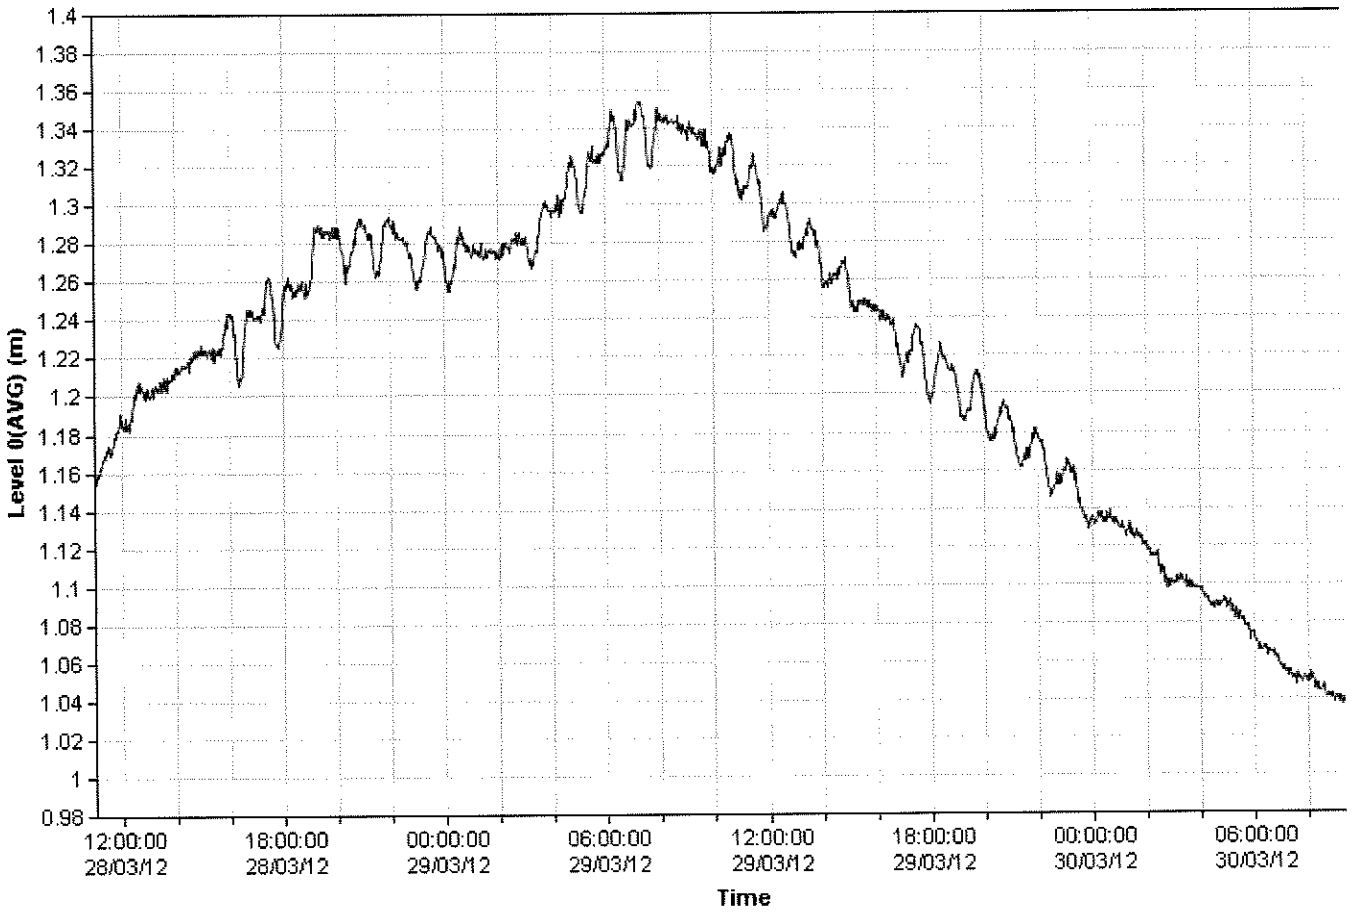
Subject: Mamquam Ramping Exceedance

Hello Francesca and Vince,



Mamquam had 2-3 slight exceedances of the ramping guideline of 3.6 cm/hr (which correlates to 2.5cm/hr in the stranding hot spots). The worst exceedance was 4.1 cm/hr, which equates to approximately 2.9cm/hr in the stranding areas.

The reason for the ramping exceedance was:

- Intake pond levels started dropping due to diminishing flows
- The weirs inflated to maintain intake levels
- Spill over the intake weirs diminished due to dropping river flows

As seen in the accompanying graph, this occurred several times as the weirs inflated to maintain intake pond levels. This is the first time we have observed the weirs causing ramp rate exceedances, probably due to the high natural rate of the river flow drop. Also, normally we would have had a second unit online so there would be no weir involvement at those flow levels (as there would be no spill), however G2 was offline for repairs.

Ecofish is conducting a stranding search and will provide a report later today or Saturday, although no fish stranding is expected. Mamquam will also work with our PLC programmers to see if the programming can be changed to allow for smaller increments of weir inflation levels.

Subject: Clowhom Power - Ramping Report

Aman,

On behalf of Clowhom Power L.P., I wanted to inform you of a ramping non-compliance at the Lower Clowhom power plant that occurred when the unit underwent an emergency shutdown due to a programming error. The event occurred on August 23 at approximately 12:45 AM.

As part of our ongoing efforts to maintain full compliance with ramping restrictions, we recently modified plant programming to divert all flow to the bypass valve in the event of an emergency shutdown. In this case, the programming failed to do this and flow through the penstock was cut off instead. This caused a ramping non-compliance due to a flushing flow in the diversion reach, and a reduction of flow downstream of the powerhouse. In the diversion reach the non-compliance lasted approximately 1 hour with a maximum ramping rate of 0.581 m/h.

Full flow at the downstream gauge was restored in approximately half an hour. See the table below for the stage and ramping rate observed downstream of the powerhouse.

Date/Time	Stage (m)	Ramping Rate (m/h)	
23/08/12 12:40 AM	0.501	-0.01	Ok
23/08/12 12:45 AM	0.406	-0.098	>0.05
23/08/12 12:50 AM	0.135	-0.37	>0.05
23/08/12 12:55 AM	0.113	-0.393	>0.05
23/08/12 1:00 AM	0.088	-0.419	>0.05
23/08/12 1:05 AM	0.081	-0.423	>0.05
23/08/12 1:10 AM	0.107	-0.396	>0.05
23/08/12 1:15 AM	0.484	-0.025	Ok

As a follow up to this event, the contractor responsible for plant programming was contacted immediately and is investigating the root cause of the shutdown as we speak. Clowhom Power takes these events very seriously and will take all steps necessary to ensure that a similar event does not occur.

Please let us know if you have any questions or concerns.

Sincerely,

Kyle Edwards, BASc, EIT
Operations Engineer

Subject: RE: Clowhom Power - July 2012 Montlhly Compliance Report

Gents,

I notice that the non-compliances (ramping & maximum diversion) persist at Lower Clowhom. These same issues occurred in previous months (see reports from June, May, etc.), and the definition of 'compliance' is closely related to statistical methods (e.g. averaging duration) subjectively applied by the proponent.

For example, the maximum allowable diversion is being defined by the proponent as an average value over some interval, rather than an instantaneous value. I strongly suggest that it is not appropriate to define 'allowable excursions' from maximum diversion (or IFR) on the basis of averages or consecutive 5-minute non-compliances, and to then suggest that any exceedance is 'within the error of the current meter'. Rather, maximum diversion should be reduced to ensure that there are zero exceedance. Similar comments & guidance could be made regarding any IFR non-compliances (ie. increase IFR releases accordingly to ensure that there are no instances of IFR non-compliance). Simply put: operations should not be run so close to the compliance thresholds that it is contingent on mathematical manipulation.

I appreciate the adjustment in operations acknowledged in the August 3 2012 cover letter (& July 2012 compliance data) to ensure 'future compliance with ramping thresholds', but remind all of us that these projects have not yet had their OPP 'accepted' by the SDM, and it is this OPP which defines the formulae for ramping compliance. Please be reminded of condition #7 in the ILCOs which specify that the final OPPR must be submitted to the satisfaction of the Assistant Regional Water Manager by September 30 2012 (including a number of data gaps). Given that the edited & accepted versions of the OPPR (& associated final ramping reports) are due in approx. 6 weeks from now, I encourage the proponent & Authorizations staff to allow adequate time for provision of feedback from technical reviewers (such as myself), as needed.

On a related note, the ramping study report (condition #4) has the same Sept. 30 2012 deadline, but I understand that a draft version of the Lower Clowhom report was submitted in July 2012, and that the Upper Clowhom report is expected shortly...

Scott

PS Were the reports pertinent to condition #3 of the ILCO (the IFR rating curves), which were due April 30 2012, ever submitted? I don't remember ever seeing them.

Mr. Davies,

Please accept the attached April 2012 Monthly Compliance Reports for the Upper and Lower Clowhom hydroelectric sites, submitted in accordance with the conditions of the Interim Leaves to Commence Operations, dated August 4, 2011 and their respective extensions dated December 23, 2011.

Please contact Robert Kulka or me with any questions or concerns.

Sincerely,

Kyle Edwards, BASc, EIT

Subject: Clowhom Power - Ramping Report

Aman,

On behalf of Clowhom Power L.P., I wanted to inform you of a potential ramping non-compliance at the Lower Clowhom power plant that occurred when the unit shut down due to a vibration trip. The event occurred on May 2 at 10:20 AM at the gauge downstream of the powerhouse. The total duration of the event is approximately 10 minutes. Two criteria for ramping non-compliance were approximately at their respective threshold as described here:

1) Ramping events that recover the pre-event stage within 10 minutes don't constitute a non-compliance, while this event lasted approximately 10 minutes;
2) Ramping restrictions do not apply for flow conditions above MAD (11.6m^3/sec): at the time of the event the plant flow was 8.3 m^3/sec and IFR flow measured d/s of the intake was 1.4 m^3/sec, therefore the minimum flow without tributary contributions at the powerhouse was 9.7 m^3/sec. It can be assumed that tributary contribution was very likely more than 1.9m^3/sec and ramping restrictions would not have applied downstream of the powerhouse. However, without support of this assumption CPLP believes that a notification is warranted.

The following ramping occurred:

Date/Time	DS Water Level	DS Ramping Rate (m/h)
02/05/2012 10:05	0.877	-0.066
02/05/2012 10:10	0.845	-0.091
02/05/2012 10:15	0.874	-0.056

The data that was used to identify this potential non-compliance was obtained from the gauge downstream of the powerhouse that was recently installed and tied into the plant HMI. This data is considered preliminary as the new gauge has not yet been fully tested and commissioned.

As a follow up to this event, the contractor responsible for plant programming was contacted immediately and was able to immediately find and fix the problem in the logic that caused the potential ramping violation. As you know, the criteria for non compliance will be reviewed during the ramping rate study to be completed by fall of this year. We expect that the threshold for ramping restrictions will be lowered below the current level of 100% MAD which would mean that the hereby reported event would not be considered a ramping non-compliance.

Please let us know if you have any questions or concerns.

Sincerely,

Kyle Edwards, BASc, EIT
Operations Engineer

Subject: Clowhom Power - Ramping Report

Aman,

On behalf of Clowhom Power L.P., I wanted to inform you of a potential ramping non-compliance at the Lower Clowhom power plant that occurred when the unit transitioned from two runner operation to one runner operation. The event occurred on April 13 at 10:20 AM. The total duration of the event was approximately one hour, with intermittent increases and decreases in penstock flow above the target flow change amount of 0.5 m3/s/h.

This event is a potential non-compliance which will be verified once the downstream logger data has been downloaded and analyzed later this week or early next week. Our operations staff and plant programmer are currently reviewing the plant data, and will proceed with an upgrade to the runner transition logic, that will prevent similar occurrences, as soon as possible.

As you know, the criteria for non compliance will be reviewed during the ramping rate study to be completed by fall of this year. Please let us know if you have any questions.

Sincerely,

Kyle Edwards, BASc, EIT
Operations Engineer

Subject: RE: Clowhom Power - Ramping Report

Aman,

Information on follow up actions have been provided with the monthly compliance reports (I refer to our submissions dated December 15, 2011, January 11, 2012, February 15, 2012, and March 13, 2012). As you know, non-compliances are detected at stations that communicate live with the control logic, but the actual stations within the stream at its most sensitive locations to confirm compliance don't have means of live communication and have limited access. In the months where we were able to obtain this data prior to submission of the monthly compliance reports, we were able to demonstrate that the majority of ad-hoc reported non-compliances were in fact not causing a non-compliance at the sensitive locations based on the current criteria for non compliance. Based on this the statistics for the last two months are as follows:

Lower Project, January 2012
Potential non-compliances reported: 4
Confirmed non-compliances: 1

Lower Project, February 2012
Potential non-compliances reported: 4
Confirmed non-compliances: 0

Upper Project, January 2012
Potential non-compliances reported: 3
Confirmed non-compliances: 1

Upper Project, February 2012
Potential non-compliances reported: 2
Confirmed non-compliances: 0

All of the confirmed non-compliances were within 20% of the allowable limits. We believe that there is a reasonable chance that the ramping rates study schedule for summer 2012 will likely increase the allowable limits, possibly above the limits that were exceeded in recent months. This would mean that in retrospective all non-compliances for 2012 would in fact be compliant with potential new limits. This is of course speculative and should not imply that CPLP is not aiming to meet current requirements for compliance. We believe that the track record as derived from the monthly reports demonstrates that a) CPLP is diligently reporting all potential non-compliances, b) actual non-compliance events have significantly decreased down to zero in the month of February and c) the decreased numbers of potential and actual non compliances and their reduced magnitude demonstrates that the changes implemented by CPLP in recent months are having a positive impact on the operations. CPLP continues to apply significant resources to further improve the operations.

The annual report under the OEMP for 2011 is scheduled for submission in late March 2012 and will provide an assessment of the potential impacts of ramping non compliances. Please clarify what additional information with reference to the monthly compliance reports and the pending 2011 OEMP report your agency wishes to obtain in the requested summary report. If deemed beneficial, we could revise the November and December 2011 compliance reports with the now available data from the sensitive locations. The review of the data will likely reduce the number of non-compliances as it was already the case for January and February 2012.

We are available for a meeting to discuss these issues and to assure that the ministry is fully aware of all aspects of the operations.

Regards, Robert

Subject: RE: Clowhom Power - Ramping Report

Kyle,

Clowhom Power L.P is reporting us the ramping non compliances occurring off and on at the Clowhom power plants (upper & lower), thanks for that but we haven't received any information either on follow up actions to prevent these in future nor on the impacts if any resulted from these events. Even we haven't the received the completed Incident Report Form(s) despite our reminders to do so.

We are very concerned regarding these on-going non-compliances and would advise Clowhom Power to take necessary appropriate remedial measures to prevent these ramping events. Clowhom Power is once again advised to provide the completed IRFs for all the events along with a summary report for the period from ILCO issue date to end of February 2012. We would expect this by the end of this month ie. March 31, 2012.

Please contact me if you have any questions in this regard.

Regards,

Aman

Subject: Clowhom Power - Ramping Report

Aman,

On behalf of Clowhom Power L.P., I wanted to inform you of a potential ramping non-compliance at the Lower Clowhom power plant that occurred when the plant shut down due to low water. The event occurred on March 14 at 2:15 AM. The duration of the event was approximately 70 minutes, with a maximum ramping rate of 0.091 m/h at the IFR gauge compared to the target of <0.075 m/h. This was a minor flushing event at the IFR gauge. The flow ramping rate of the plant was very close to the minimum rate of -0.50 m3/s/h and only saw a maximum of about -0.53 m3/s/h.

Based on comparable past events, and the observed correlation between stage changes at the IFR gauge and sensitive location within the diversion reach, we are confident that allowable stage change within the diversion reach was not exceeded during this event. This will be verified once the logger data has been downloaded and analyzed. Nonetheless, this event remains a reportable potential non-compliance under the current interim leave to operate.

Please let us know if you have any questions.

Sincerely,

Kyle Edwards, BASc, EIT

Subject: Lower Clowhom ramping rate compliance screening protocol
Attachments: m-2008-01-18-LCH Ramp-Mar12.pdf

Aman,

Please find attached a memo describing a ramping rate data review and revision of the ramping rate compliance screening protocol at the Lower Clowhom project. The update is based on improvements to data quality and quantity over the past 6 months. This does not represent a request to change the prescribed ramping rate (5cm/hr at sensitive location), just the way data are screened for compliance monitoring purposes. Please get in touch with Robert Kulka of Clowhom Power LP, or myself, if you have questions or comments.

Re: Lower Clowhom Ramping Rate Non-Compliance Thresholds

Pottinger Gaherty Environmental Consultants Ltd. (PGL) and Clowhom Power Ltd. Partnership have reviewed the way ramping rate compliance monitoring is undertaken at the Lower Clowhom plant. Based on improved data quality and quantity from the instream monitoring sites in late 2011 and early 2012, results support a revision to the current compliance threshold at the instream flow requirements (IFR) logger from the present 0.075m/hr to 0.100m/hr. This revision relates only to compliance monitoring at the Lower Clowhom IFR location. The effective rate of 0.05m/hr at the biologically sensitive diversion reach location remains unchanged. The background and rationale for the proposed revision are provided below.

BACKGROUND

The approved ramping rate for stage changes from the Lower Clowhom project is 0.05m/hr, measured at a biologically sensitive location. A transducer at the Lower IFR monitoring site (LIFR) in the diversion reach has been in place full-time since 2009, but is not located in a biologically sensitive location. In 2010, a pressure transducer was installed at a biologically sensitive location (site LDR) in the diversion reach to specifically monitor ramping rates against the 0.05m/hr threshold. Data from LIFR are available on sub-daily time frames, but LDR data require manual downloads from the transducer.

To make compliance monitoring more efficient, data from the LIFR location were compared to the LDR location, so that the more readily-available LIFR data could be used to screen for ramping rate non-compliance events. Because of the morphology of the LIFR location, a given flow event will create a larger stage change at that location compared to the LDR location. A review of the first six months of paired data from LIFR and LDR sites was undertaken in spring 2011[1]. It was evident at this time that the data from LDR were prone to excessive "noise", and the resulting correlation between data from the LIFR gauge and the LDR gauge was poor. A conservative value of 0.075m/hr at the LIFR location was chosen for screening ramping rate compliance at the other diversion reach site, LDR. It was noted at the time that in virtually all cases, stage changes greater than 0.075m/hr at the LIFR site still did not exceed 0.05m/hr at the LDR site, but that with the high noise factor, a small number events as low as 0.075m/hr at the IFR site also exceeded 0.05m/hr at LDR. As a result, a non-compliance response protocol is presently initiated for any rate calculated at LIFR that exceeds +/- 0.075m/hr.

In October 2011, Clowhom Power Ltd. Partnership relocated the LDR logger to a new site (LDR-2), verified by PGL to satisfy the "biologically sensitive" characterization. The new LDR-2 location was expected to provide more stable results than its predecessor at LDR.

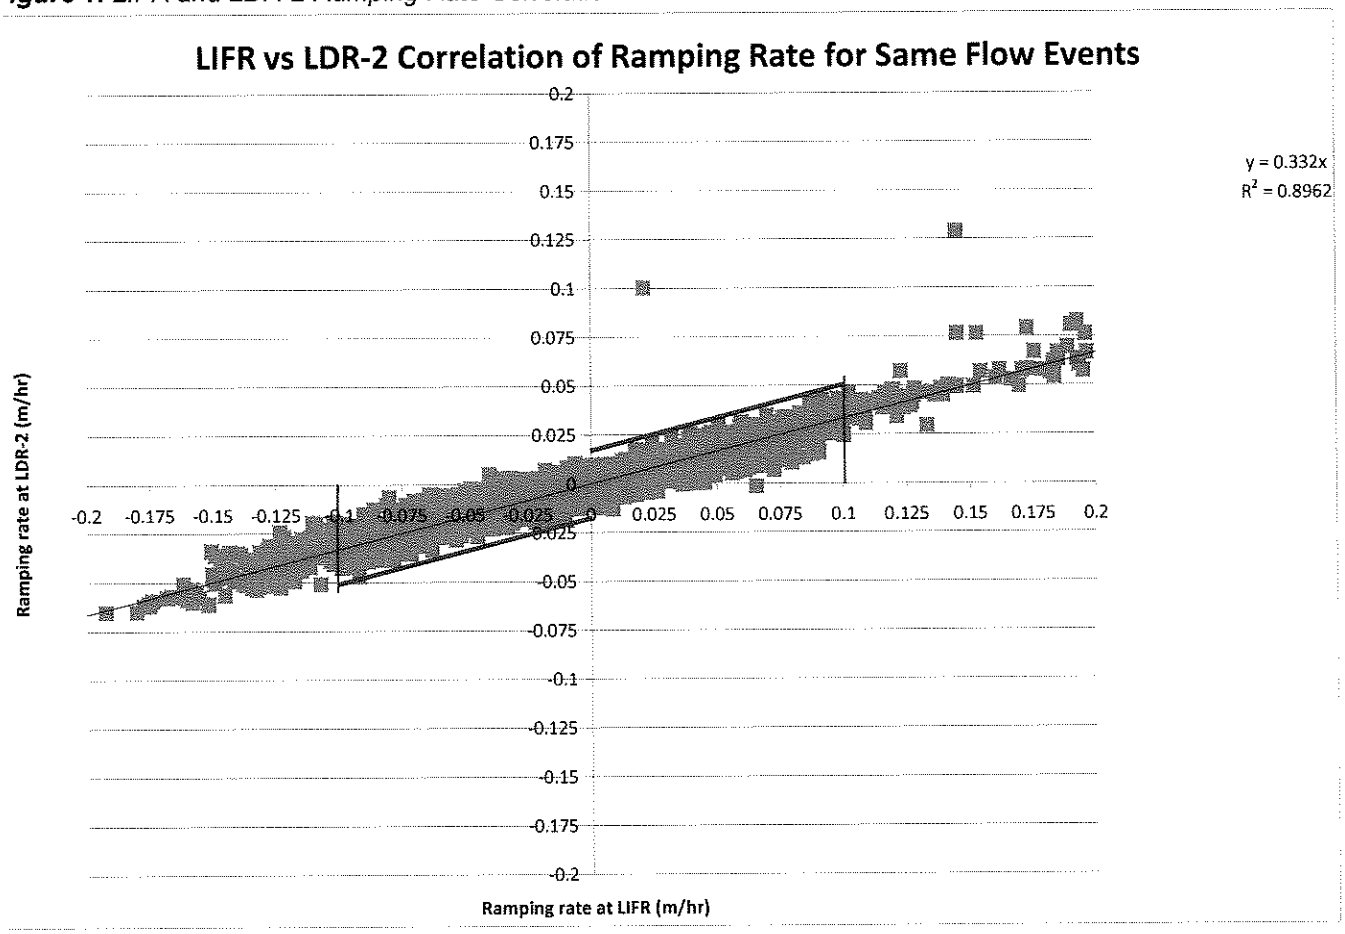
[1] 2010 Supplemental Ramping Rate Report by PGL

CORRELATION BETWEEN LDR-2 AND LIFR

In March 2012, Clowhom Power Ltd. Partnership reviewed the paired data from the LIFR gauge and the new LDR-2 gauge, covering the period from October 19, 2011 through February 29, 2012. Each logger records water levels every five minutes, and the dataset comprised 8741 data points. The results of the data analysis were provided to PGL for review and comment.

Ramping rates at each of the two locations were calculated as the difference in water level at a given reading compared to one hour previous, resulting in a time series of ramping rates (m/hr) at each. As ramping rates at Lower Clowhom apply only for flow conditions below mean annual discharge (11.6m^3/s), data were filtered to only include the applicable low-flow conditions. To match the two time series from LIFR and LDR-2, the time series at LDR-2 was offset incrementally by 5, 10, 15, 20, and 25 minutes, to find the time lag that maximized the correlation between the two sets. A time lag of 15 minutes maximized the linear correlation (r = 0.942). The time lag is effectively a measurement of the average travel time from the Lower IFR gauge to the LDR-2 gauge under low flow conditions.

As expected, the data from LDR-2 have proven to be more stable and reliable than LDR. A manual review of all filtered data from October 19 2011 through February 29 2012 showed the minimum stage increase at LIFR that also led to an increase at LDR-2 of greater than 0.05m/hr was 0.122m/hr. The minimum stage decrease at LIFR that also led to a decrease at LDR-2 of less than -0.05m/hr was -0.108m/hr.



To give a more generalized characterization of the relationship between LIFR and LDR-2 ramping rates, the time series were plotted (Figure 1, attached). It is evident from the figure that (a) the linear fit between the two time series is strong (R^2 = 0.8962); (b) the LIFR site is much more sensitive to stage fluctuations (a slope of 0.332 implies that on average, a given flow change will create a ramping rate at LIFR that is 300% larger than at LDR-2). The bold red lines on Figure 1 show that after accounting for the variance around the mean fitted value, compliance with 0.05m/hr at LDR-2 can be achieved by restricting ramping rates at LIFR to +/- 0.10m/hr. Therefore, its PGL's opinion that a revised ramping compliance threshold of 0.10m/hr assures that ramping compliance at the biologically sensitive site within the diversion reach will be maintained.

This revised compliance threshold will be applied only to determine compliance at the sensitive site in the diversion reach. The compliance criteria for downstream of the powerhouse remains unchanged.

If you require further information or have questions/comments, please contact me at 604-895-7666 or tgray@pggroup.com

Subject: Clowhom Power - Ramping Report

Aman,

On behalf of Clowhom Power L.P., I wanted to inform you of a potential ramping non-compliance at the Lower Clowhom power plant that occurred when the unit transitioned from two runner operation to one runner operation. The event occurred on April 13 at 10:20 AM. The total duration of the event was approximately one hour, with intermittent increases and decreases in penstock flow above the target flow change amount of 0.5 m3/s/h.

This event is a potential non-compliance which will be verified once the downstream logger data has been downloaded and analyzed later this week or early next week. Our operations staff and plant programmer are currently reviewing the plant data, and will proceed with an upgrade to the runner transition logic, that will prevent similar occurrences, as soon as possible.

As you know, the criteria for non compliance will be reviewed during the ramping rate study to be completed by fall of this year. Please let us know if you have any questions.

Sincerely,

Kyle Edwards, BASc, EIT
Operations Engineer

Subject: Clowhom Power - Ramping Report

Aman,

On behalf of Clowhom Power L.P., I wanted to inform you of a potential ramping non-compliance at the Lower Clowhom power plant that occurred when the unit shut down due to a vibration trip. The event occurred on May 2 at 10:20 AM at the gauge downstream of the powerhouse. The total duration of the event is approximately 10 minutes. Two criteria for ramping non-compliance were approximately at their respective threshold as described here:

1) Ramping events that recover the pre-event stage within 10 minutes don't constitute a non-compliance, while this event lasted approximately 10 minutes;
2) Ramping restrictions do not apply for flow conditions above MAD (11.6m^3/sec): at the time of the event the plant flow was 8.3 m^3/sec and IFR flow measured d/s of the intake was 1.4 m^3/sec, therefore the minimum flow without tributary contributions at the powerhouse was 9.7 m^3/sec. It can be assumed that tributary contribution was very likely more than 1.9m^3/sec and ramping restrictions would not have applied downstream of the powerhouse. However, without support of this assumption CPLP believes that a notification is warranted.

The following ramping occurred:

Date/Time	DS Water Level	DS Ramping Rate (m/h)
02/05/2012 10:05	0.877	-0.066
02/05/2012 10:10	0.845	-0.091
02/05/2012 10:15	0.874	-0.056

The data that was used to identify this potential non-compliance was obtained from the gauge downstream of the powerhouse that was recently installed and tied into the plant HMI. This data is considered preliminary as the new gauge has not yet been fully tested and commissioned.

As a follow up to this event, the contractor responsible for plant programming was contacted immediately and was able to immediately find and fix the problem in the logic that caused the potential ramping violation. As you know, the criteria for non compliance will be reviewed during the ramping rate study to be completed by fall of this year. We expect that the threshold for ramping restrictions will be lowered below the current level of 100% MAD which would mean that the hereby reported event would not be considered a ramping non-compliance.

Please let us know if you have any questions or concerns.

Sincerely,

Kyle Edwards, BASc, EIT
Operations Engineer

Subject: Clowhom Power - Ramping Report
Attachments: image001.png

Aman,

On behalf of Clowhom Power L.P., I wanted to inform you of a ramping non-compliance at the Lower Clowhom power plant that occurred when the unit underwent an emergency shutdown due to a programming error. The event occurred on August 23 at approximately 12:45 AM.

As part of our ongoing efforts to maintain full compliance with ramping restrictions, we recently modified plant programming to divert all flow to the bypass valve in the event of an emergency shutdown. In this case, the programming failed to do this and flow through the penstock was cut off instead. This caused a ramping non-compliance due to a flushing flow in the diversion reach, and a reduction of flow downstream of the powerhouse. In the diversion reach the non-compliance lasted approximately 1 hour with a maximum ramping rate of 0.581 m/h.

Full flow at the downstream gauge was restored in approximately half an hour. See the table below for the stage and ramping rate observed downstream of the powerhouse.

Date/Time	Stage (m)	Ramping Rate (m/h)	
23/08/12 12:40 AM	0.501	-0.01	Ok
23/08/12 12:45 AM	0.406	-0.098	>0.05
23/08/12 12:50 AM	0.135	-0.37	>0.05
23/08/12 12:55 AM	0.113	-0.393	>0.05
23/08/12 1:00 AM	0.088	-0.419	>0.05
23/08/12 1:05 AM	0.081	-0.423	>0.05
23/08/12 1:10 AM	0.107	-0.396	>0.05
23/08/12 1:15 AM	0.484	-0.025	Ok

As a follow up to this event, the contractor responsible for plant programming was contacted immediately and is investigating the root cause of the shutdown as we speak. Clowhom Power takes these events very seriously and will take all steps necessary to ensure that a similar event does not occur.

Please let us know if you have any questions or concerns.

Sincerely,

Kyle Edwards, BASc, EIT
Operations Engineer

Lower Clowhom - Monthly Compliance Report – April 2012

Dear Mr. Davies,

Please accept the following letter report, submitted in accordance with the conditions of the Interim Leave to Commence Operations dated August 4, 2011, and the subsequent extension dated December 23, 2011 for the Lower Clowhom power plant.

Compliance:

IFR							
Compliant							
Ramping							
Event Date/ Time	Date First Reported	Duration (h:m)	Maximum Ramping Rate* (m/h)			Cause	Conclusion
			LIFR	LDR	LDS		
4/13/12 10:20	4/16/12	1:00**	0.001	0.003	-0.053	Transition from one to two runners	Not a ramping Non-compliance as -0.053 ramping rate was only for one reading.
4/23/12 11:10	na	0:50	0.192	0.056	-0.005	Ramping down for runner testing	Possible ramping non-compliance, though partially due to naturally increasing flows.
* The Maximum Ramping Rate column above represents the single greatest ramping rate achieved and is not a rate sustained for the duration of the event. **As reported							

Summary of operational information:

Shutdowns/startups	Shutdown Date	Cause	Startup Date
	April 2, 2012	Vibration Trip	April 3, 2012
	April 23, 2012	Vibration trip	April 23, 2012
Maintenance of IFR	IFR was maintained at all times. The minimum flow in the diversion reach was 0.77 m^3/s compared to the April IFR of 0.72 m^3/s. See attached Discharge chart.		
Stage	See attached Water Level and Ramping Rate chart for hourly stage data at the diversion reach and IFR gauges.		

Diverted Flows	The maximum diverted flow was 14.92 m^3/s, compared to the water license allowable diversion of 14.84 m^3/s. There were a total of 5 readings (at 5 minute intervals) which indicated a flow of greater than 14.84 m^3/s, but there were no consecutive readings above the maximum diverted flow, and the highest reading was only higher by 0.5% which is well within the accuracy of the flow meter. See attached Flow and Stage Data.
Operational Changes	None

The ramping data attached consists of stage readings collected at 5 minute intervals, obtained from the plant HMI. Diversion reach (LDR) and downstream of powerhouse (LDS) data were obtained from Via-Sat Data Systems.

One potential ramping non-compliance reported as part of 24h reporting requirements was found to be compliant with ramping restrictions after viewing data from downstream of the powerhouse.

The above noted event on April 23 occurred while river flows naturally decreased. We are currently analyzing the data in conjunction with information collected during the ongoing ramping rate study, in particular field tests that were performed between May 8 and 10th. The conclusions of the analysis will be provided with the next monthly compliance report. We have included this event in this month's report following our conservative approach to compliance monitoring and reporting.

Sincerely,

Robert Kulka
Operations Manager

Mr. Davies,

Please accept the attached May 2012 Monthly Compliance Reports for the Upper and Lower Clowhom hydroelectric sites, submitted in accordance with the conditions of the Interim Leaves to Commence Operations, dated August 4, 2011 and their respective extensions dated December 23, 2011.

Please contact Robert Kulka or me with any questions or concerns.

Sincerely,

Kyle Edwards, BASc, EIT
Operations Engineer

Lower Clowhom - Monthly Compliance Report – May 2012

Dear Mr. Davies,

Please accept the following letter report, submitted in accordance with the conditions of the Interim Leave to Commence Operations dated August 4, 2011, and the subsequent extension dated December 23, 2011 for the Lower Clowhom power plant.

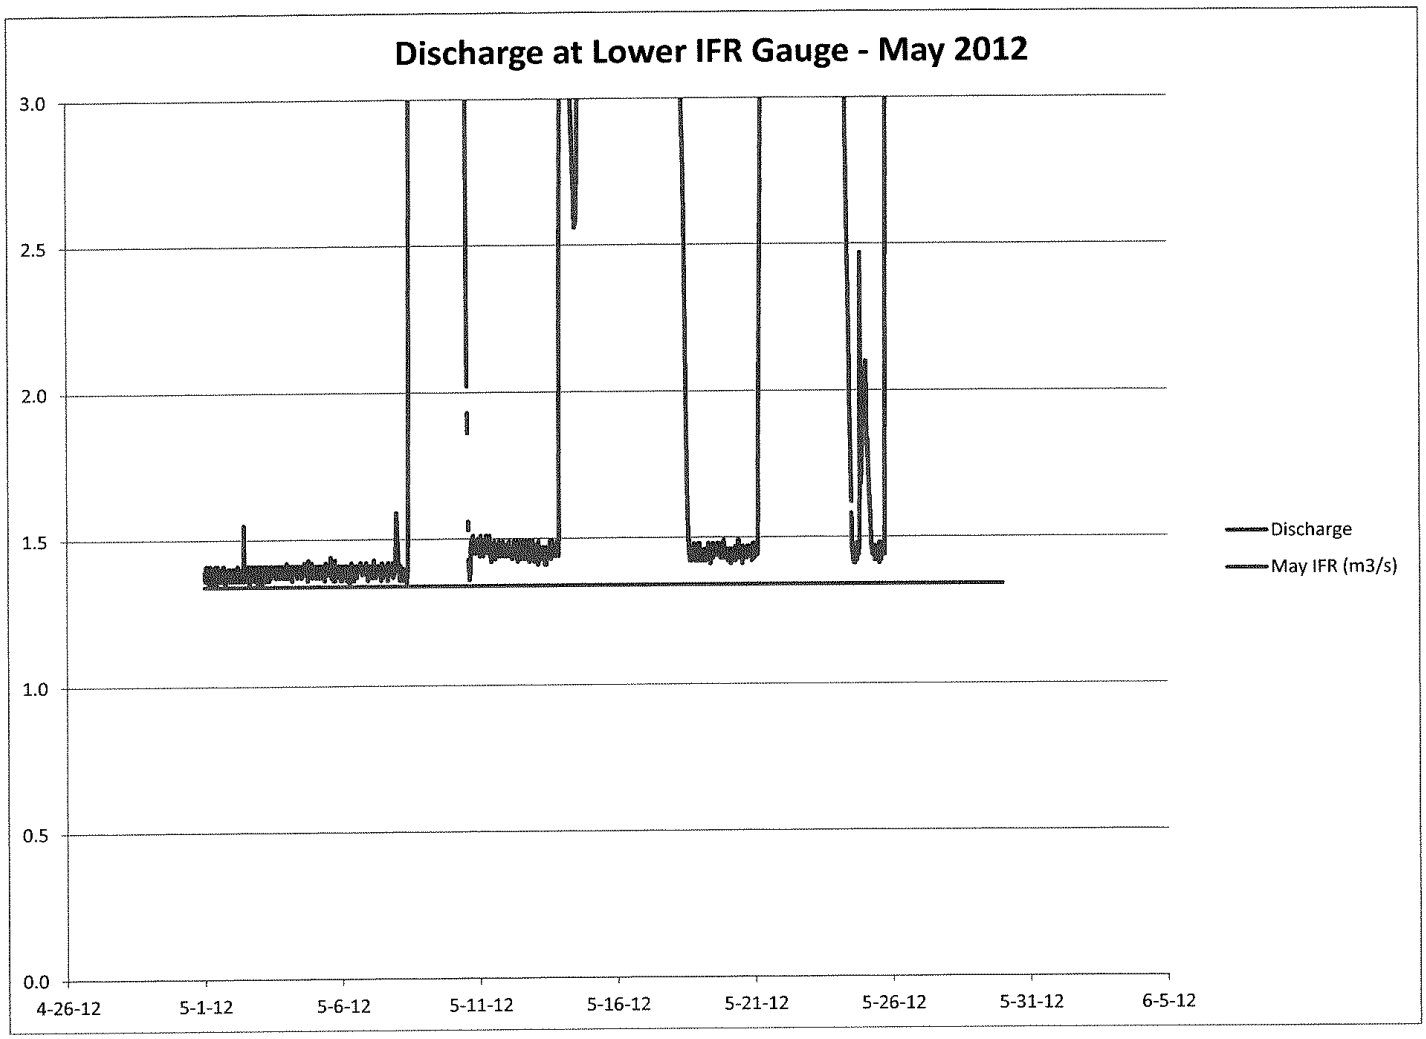
Compliance:

IFR							
Compliant							
Ramping							
Compliant – see below							
Event Date/ Time	Date First Reported	Duration (h:m)	Maximum Ramping Rate* (m/h)			Cause	Conclusion
			LIFR	LDR	LDS		
5/2/12 10:10	5/2/12	0:10**	0.021	0.001	-0.063	Vibration Trip	Not a ramping Non-compliance as -0.063 ramping rate was only for one reading. Original report was based on improperly scaled data.
* The Maximum Ramping Rate column above represents the single greatest ramping rate achieved and is not a rate sustained for the duration of the event. **As reported							

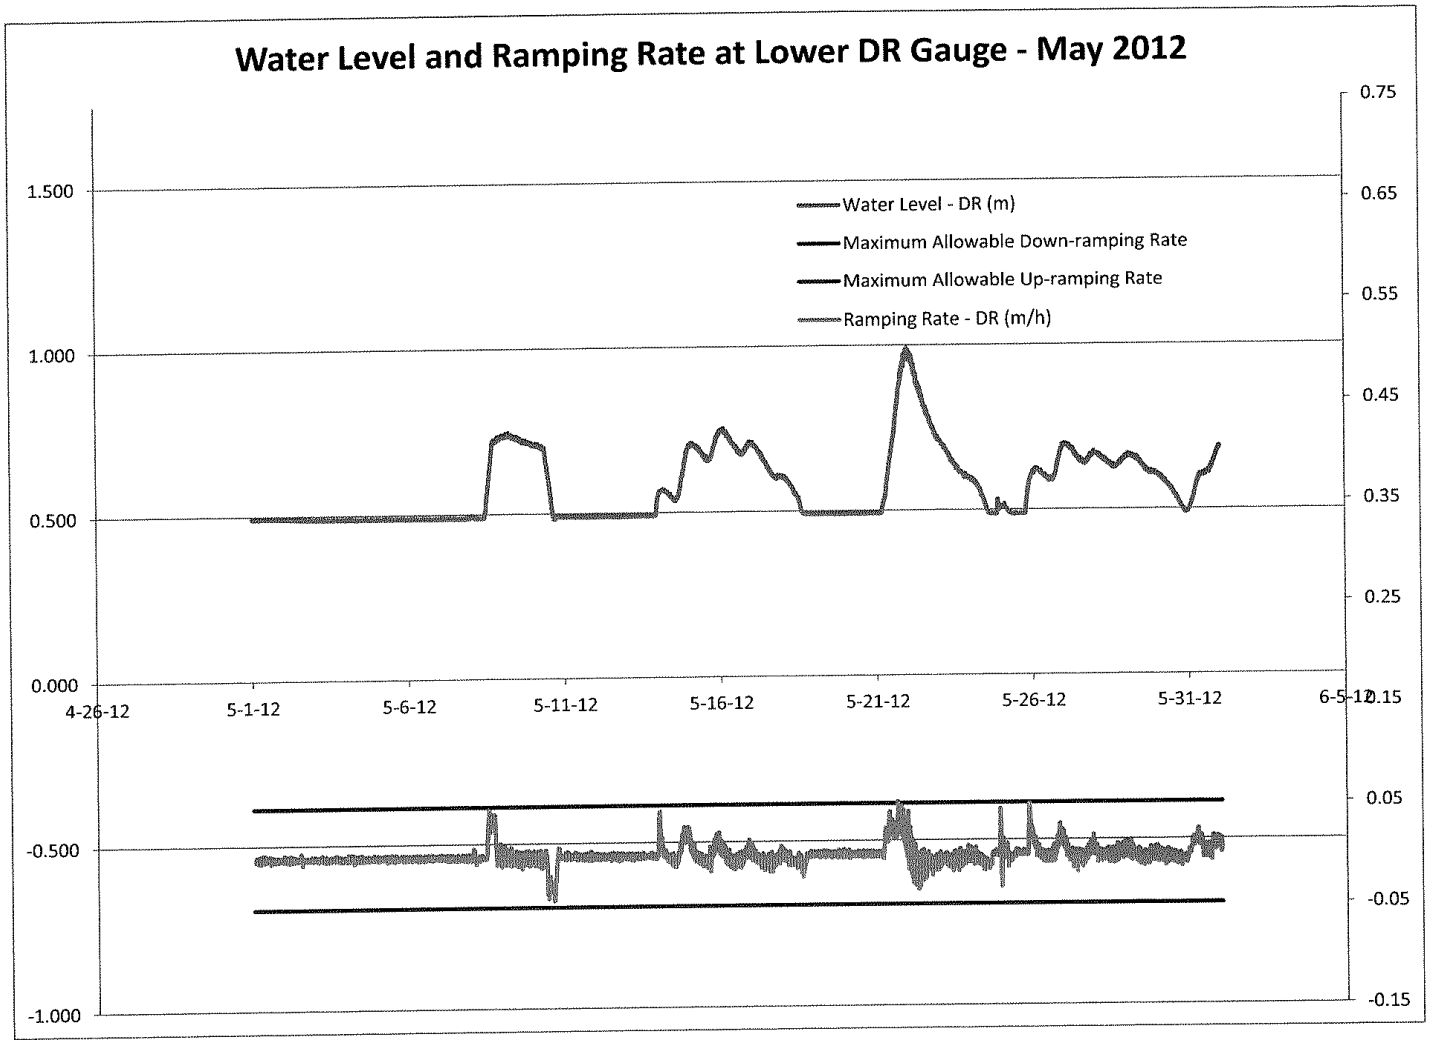
Summary of operational information:

Shutdowns/startups	Shutdown Date	Cause	Startup Date
	May 8, 2012	Ramping Rate Study	May 10, 2012
Maintenance of IFR	IFR was maintained at all times. The minimum flow in the diversion reach was 1.34 m^3/s compared to the May IFR of 1.34 m^3/s. See attached Discharge chart.		
Stage	See attached Water Level and Ramping Rate chart for hourly stage data at the diversion reach and IFR gauges.		

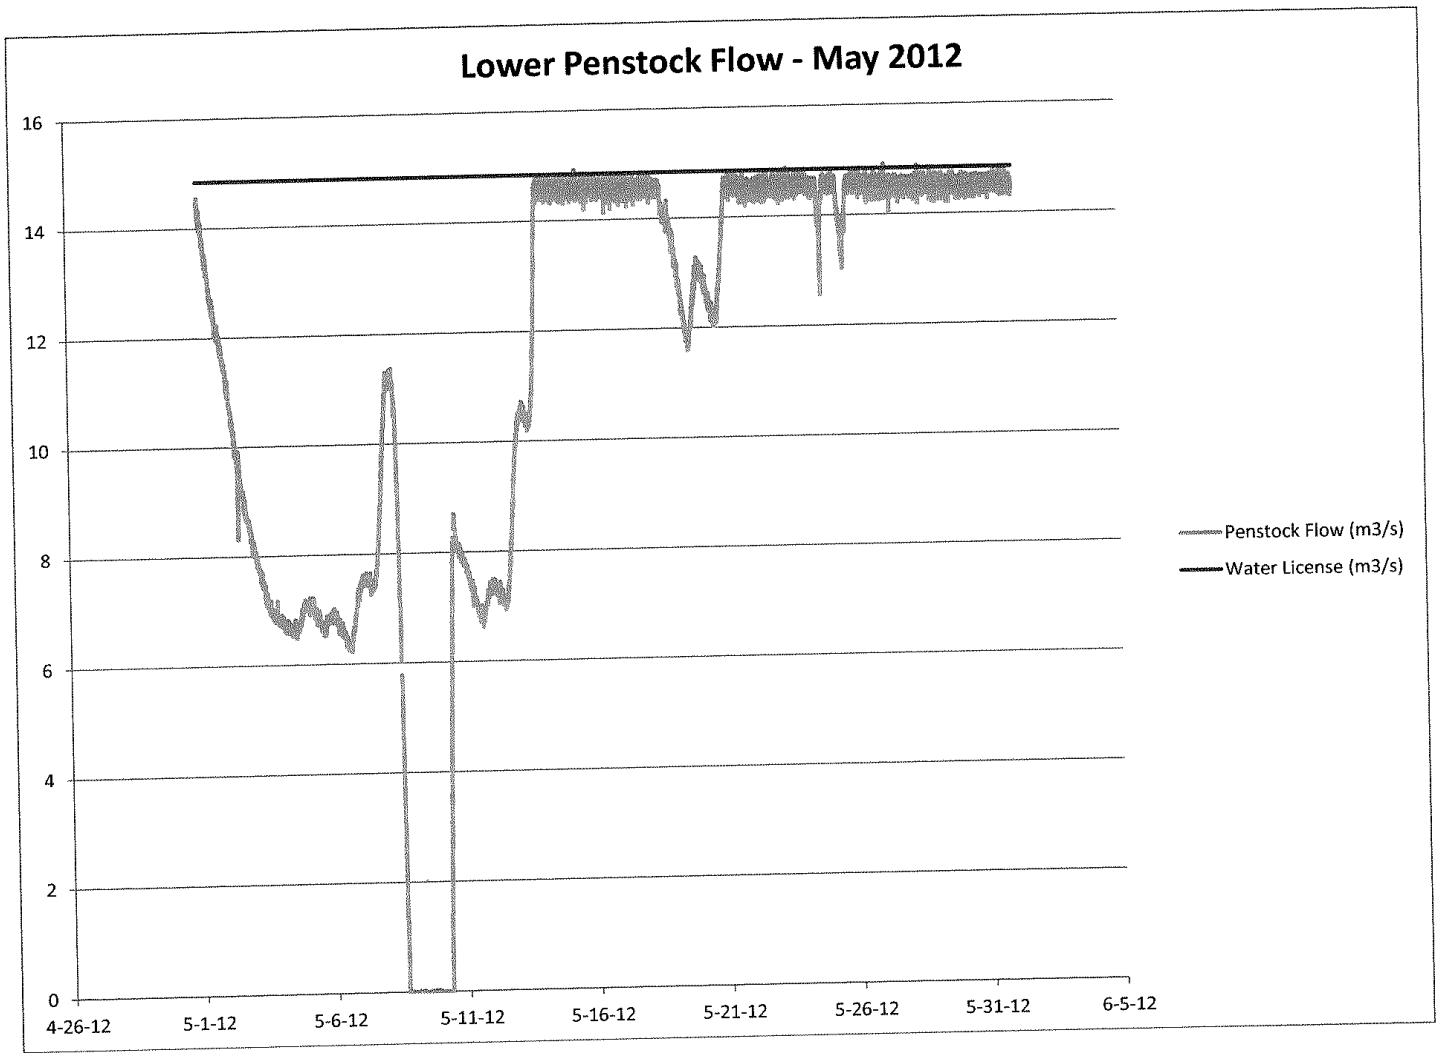
Diverted Flows	The maximum diverted flow was 14.92 m^3/s, compared to the water license allowable diversion of 14.84 m^3/s. There were a total of 8 readings (at 5 minute intervals) which indicated a flow of greater than 14.84 m^3/s, but there were no consecutive readings above 14.84 m^3/s, and the highest reading was only higher by 0.5% which is well within the accuracy of the flow meter. See attached Flow and Stage Data.
Operational Changes	On May 8-10 PGL carried out their ramping rate study at the Lower Plant. Final conclusions from the study have not yet been received, but are expected by late June.



The ramping data attached consists of stage readings from the IFR gauge collected at 5 minute intervals, obtained from the plant HMI. Diversion reach (LDR) and downstream of powerhouse (LDS) data were obtained from Via-Sat Data Systems. The LDS data provided by Via-sat was inconsistent and had many false readings, therefore we are providing data from our plant tied gauge downstream of the powerhouse as it appears to be more reliable.



One potential ramping non-compliance reported on May 12, 2012 as part of the 24h reporting requirements was found to be compliant with ramping restrictions after reviewing corrected data from downstream of the powerhouse.



Sincerely,

Robert Kulka
Operations Manager

Mr. Davies,

Please accept the attached June 2012 Monthly Compliance Reports for the Upper and Lower Clowhom hydroelectric sites, submitted in accordance with the conditions of the Interim Leaves to Commence Operations, dated August 4, 2011 and their respective extensions dated December 23, 2011.

Please contact Robert Kulka or me with any questions or concerns.

Sincerely,

Kyle Edwards, BASc, EIT
Operations Engineer

Lower Clowhom - Monthly Compliance Report – June 2012

Dear Mr. Davies,

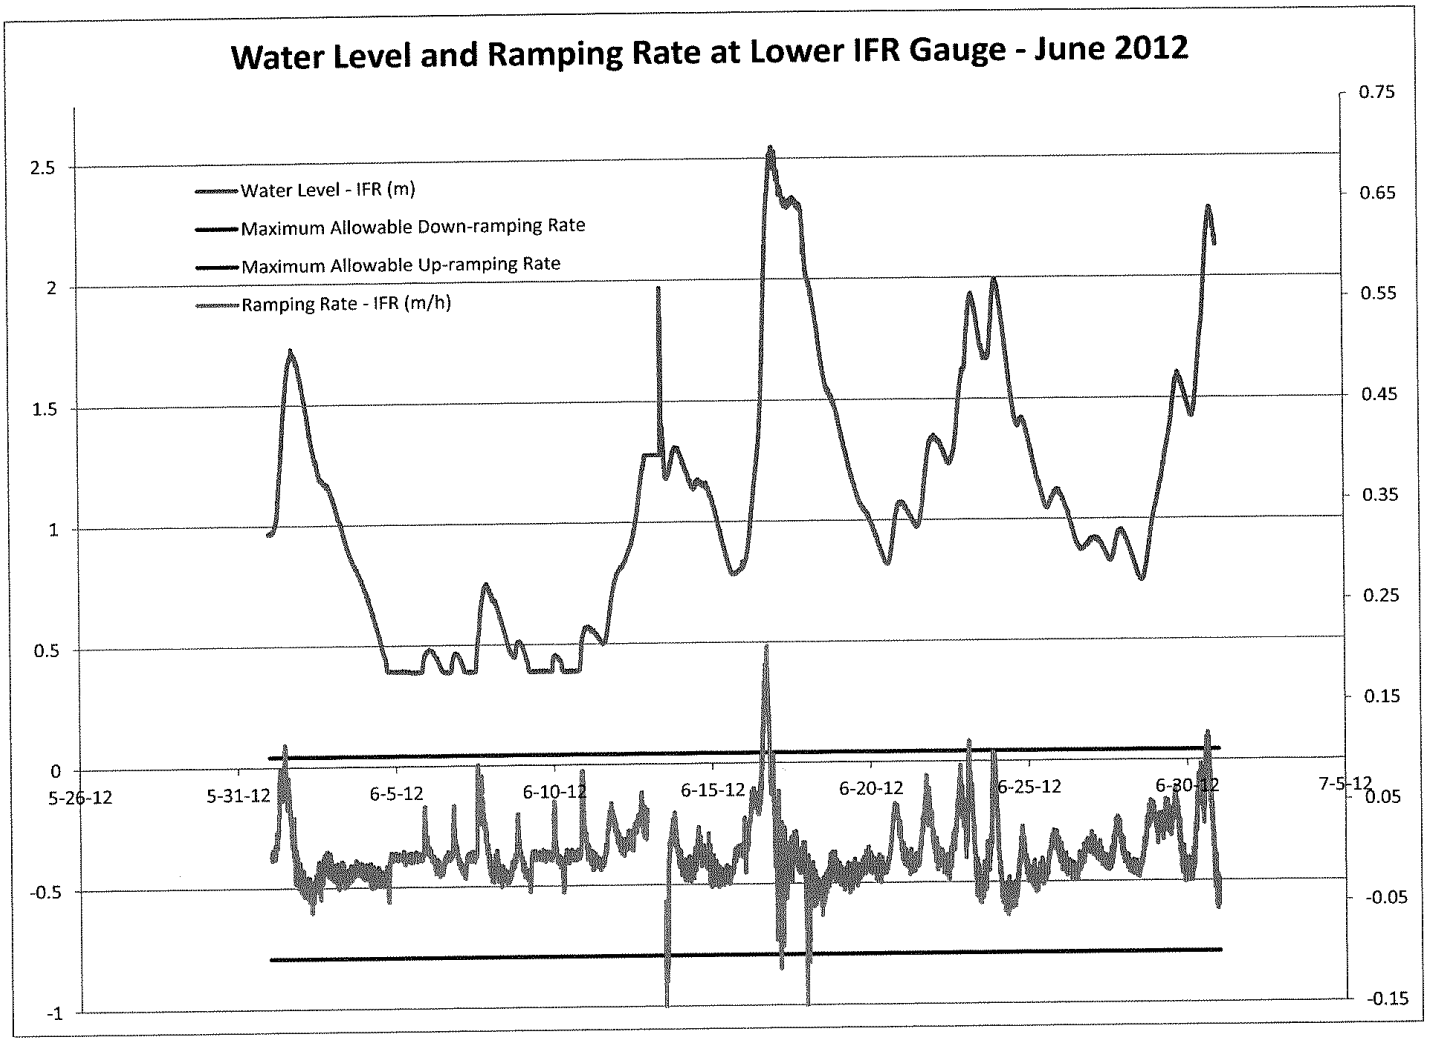
Please accept the following letter report, submitted in accordance with the conditions of the Interim Leave to Commence Operations dated August 4, 2011, and the subsequent extension dated December 23, 2011 for the Lower Clowhom power plant.

Compliance:

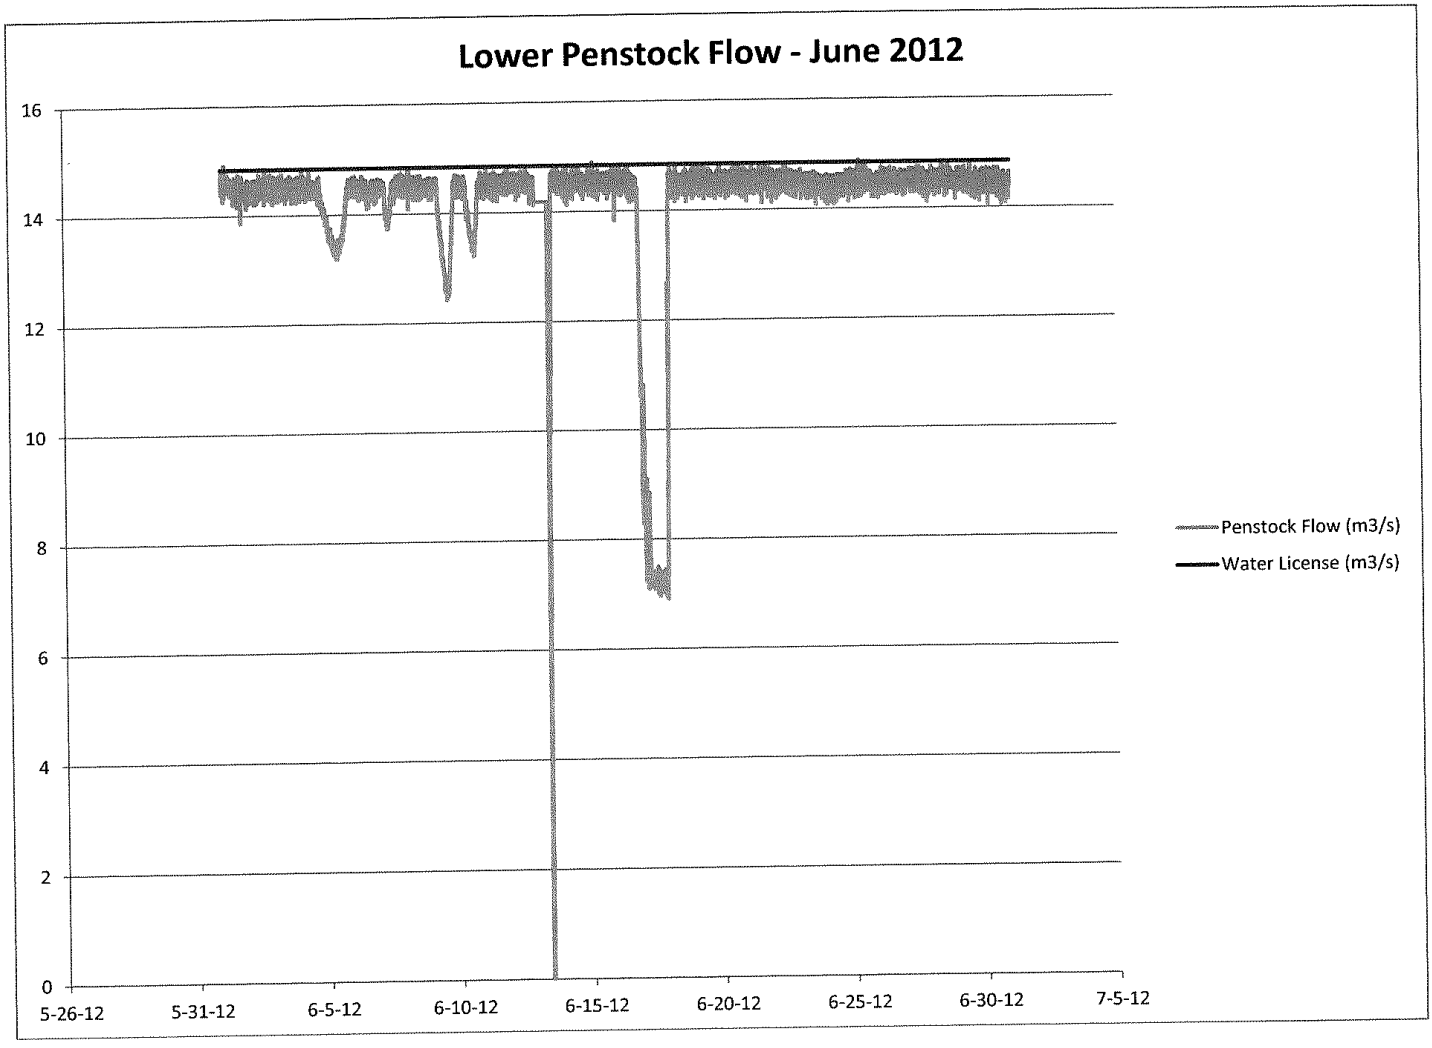
IFR
Compliant
Ramping
Compliant (based on data from IFR and DS gauges)

Summary of operational information:

Shutdowns/startups	Shutdown Date	Cause	Startup Date
	June 12, 2012	Power loss at intake	June 13, 2012
Maintenance of IFR	IFR was maintained at all times. The minimum flow in the diversion reach was 1.88 m^3/s compared to the June IFR of 1.84 m^3/s. See attached Discharge chart.		
Stage	See attached Water Level and Ramping Rate chart for hourly stage data at the diversion reach and IFR gauges.		
Diverted Flows	The maximum allowable diversion flow is 14.84 m^3/s. The maximum diverted flow single measurement was 14.92 m^3/s based on 5 minute spot readings of the flow meter. There were a total of 6 readings which indicated a flow of greater than 14.84 m^3/s, but there were no consecutive readings above 14.84 m^3/s. The maximum diverted 15 minute average flow (based on three spot readings) was 14.75 m^3/s. See attached Flow and Stage Data.		
Operational Changes	None		



The ramping data attached consists of stage readings from the IFR and DS gauges collected at 5 minute intervals by the plant HMI. DR gauge data were not obtained for the month of June.



Sincerely,

Robert Kulka
Operations Manager

Mr. Davies,

Please accept the attached June 2012 Monthly Compliance Reports for the Upper and Lower Clowhom hydroelectric sites, submitted in accordance with the conditions of the Interim Leaves to Commence Operations, dated August 4, 2011 and their respective extensions dated December 23, 2011.

Please contact Robert Kulka or me with any questions or concerns.

Sincerely,

Kyle Edwards, BASc, EIT
Operations Engineer

Lower Clowhom - Monthly Compliance Report – July 2012

Dear Mr. Davies,

Please accept the following letter report, submitted in accordance with the conditions of the Interim Leave to Commence Operations dated August 4, 2011, and the subsequent extension dated December 23, 2011 for the Lower Clowhom power plant.

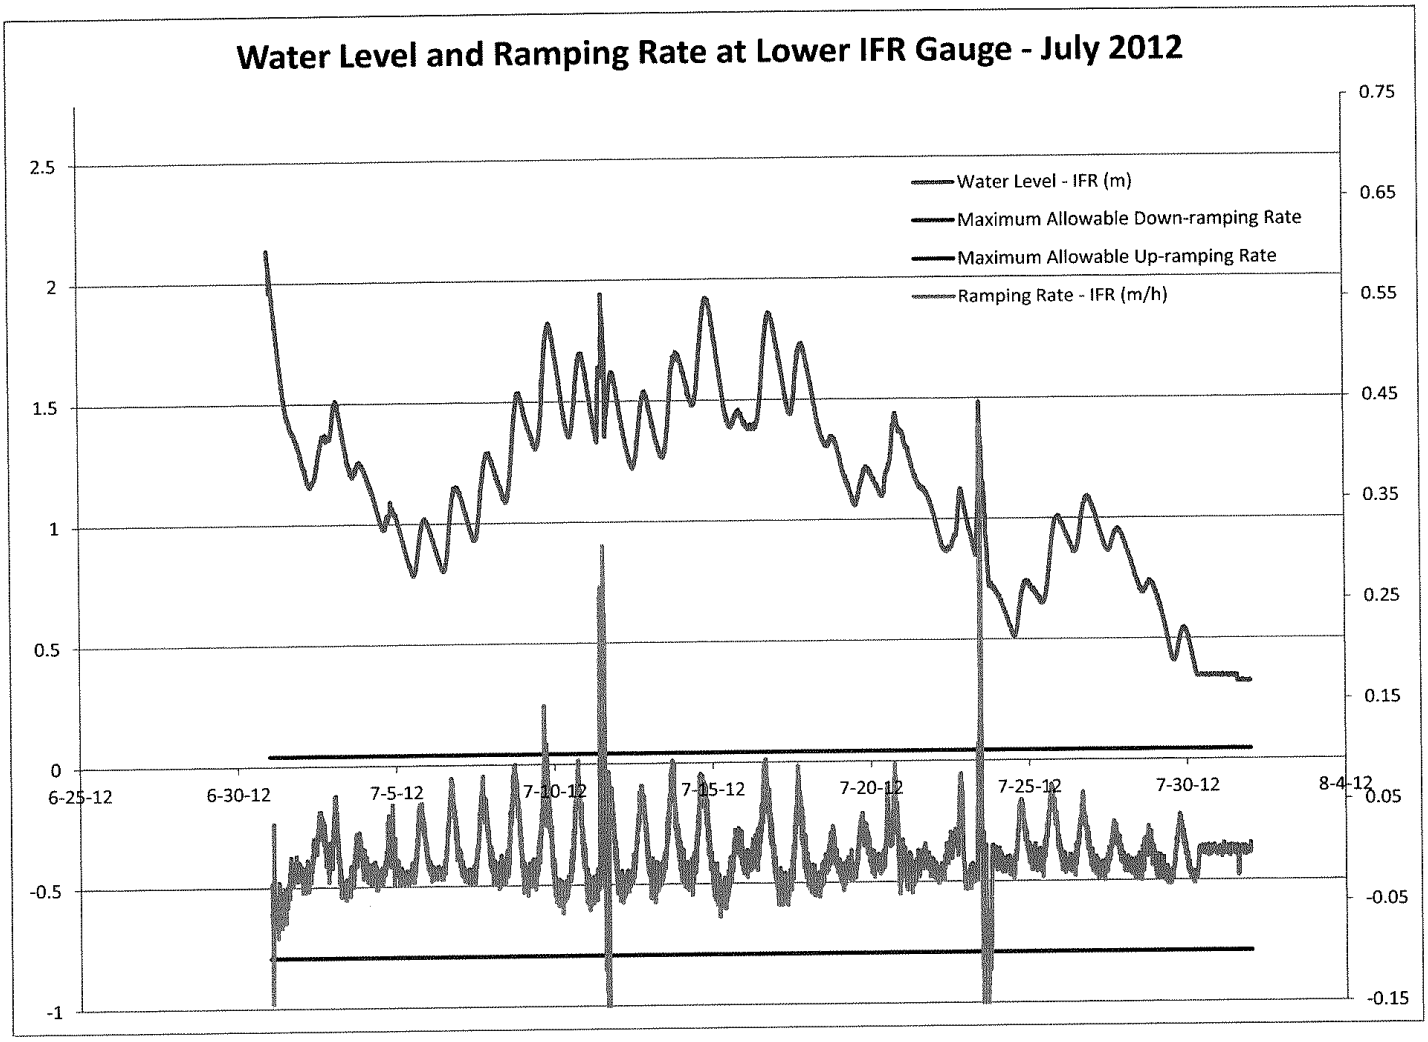
Compliance:

IFR
Compliant
Ramping
Compliant (see underneath note with regards to July 23 start up)
* The Maximum Ramping Rate column above represents the single greatest ramping rate achieved and is not a rate sustained for the duration of the event.

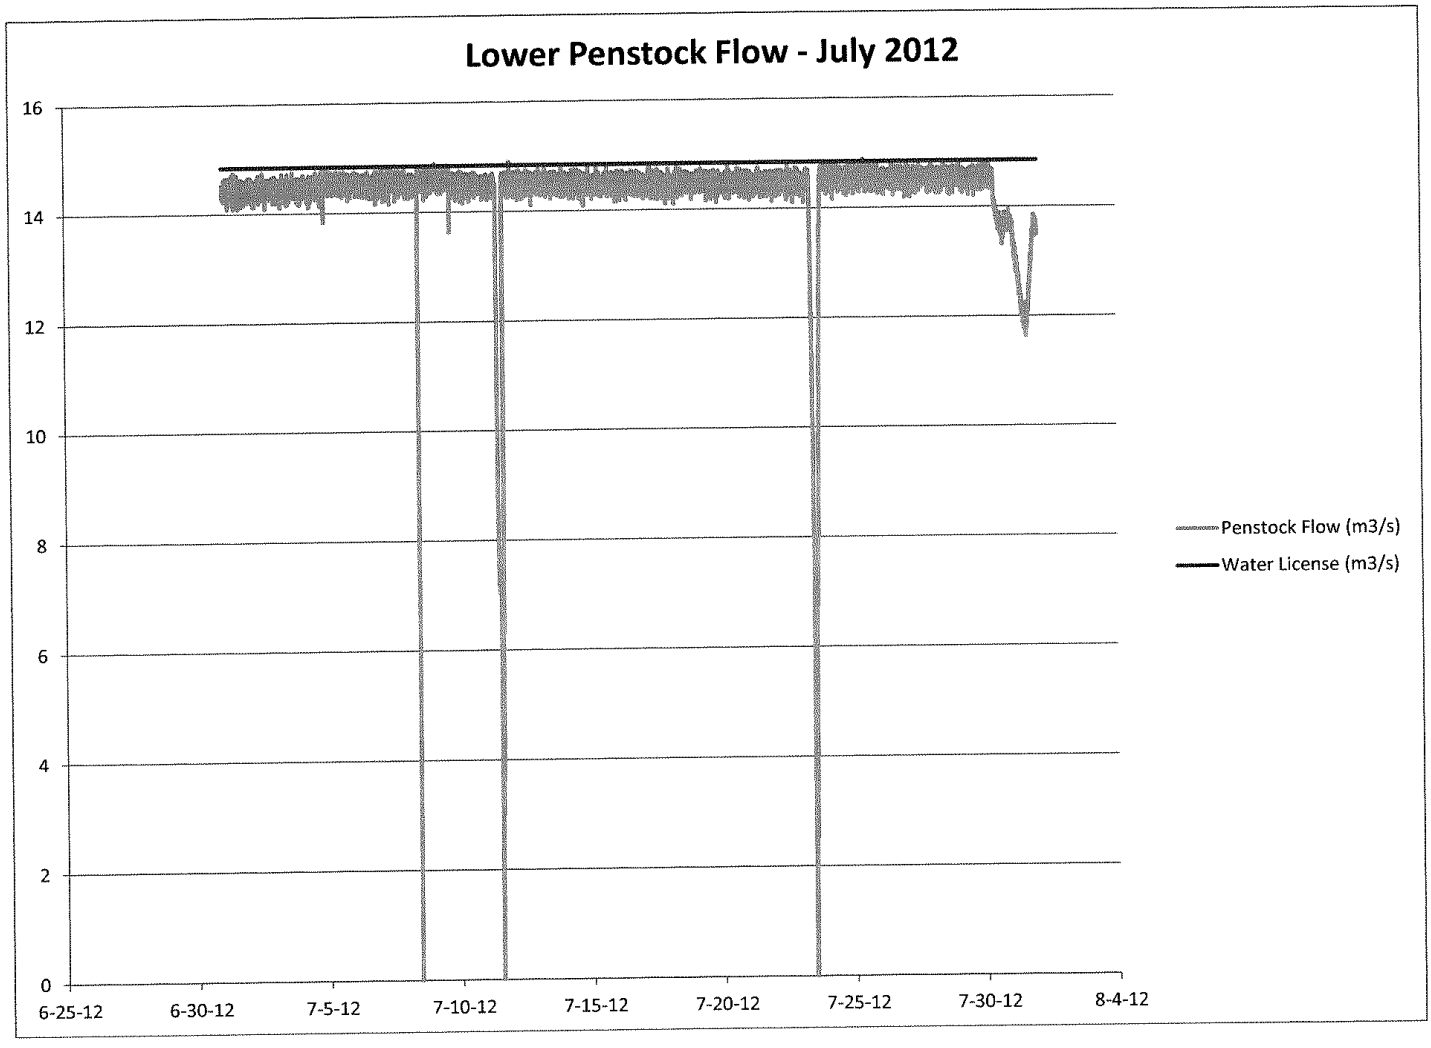
Summary of operational information:

Shutdowns/startups	Shutdown Date	Cause	Startup Date
	July 4, 2012	BC Hydro Trip	July 4, 2012
	July 8, 2012	BC Hydro Trip	July 9, 2012
	July 11, 2012	Trip on WG failed to close	July 11, 2012
	July 23, 2012	Planned for vibration work	July 23, 2012
Maintenance of IFR	IFR was maintained at all times. The minimum flow in the diversion reach was 1.40 m^3/s compared to the July IFR of 1.34 m^3/s. See attached Discharge chart.		
Stage	See attached Water Level and Ramping Rate chart for hourly stage data at the diversion reach and IFR gauges.		
Diverted Flows	The maximum allowable diversion flow is 14.84 m^3/s. The maximum diverted flow single measurement was 14.90 m^3/s based on 5 minute spot readings of the flow meter. There were a total of 5 readings which indicated a flow of greater than 14.84 m^3/s, but there were no consecutive readings above 14.84 m^3/s. The maximum diverted 15 minute average flow (based on three spot readings) was		

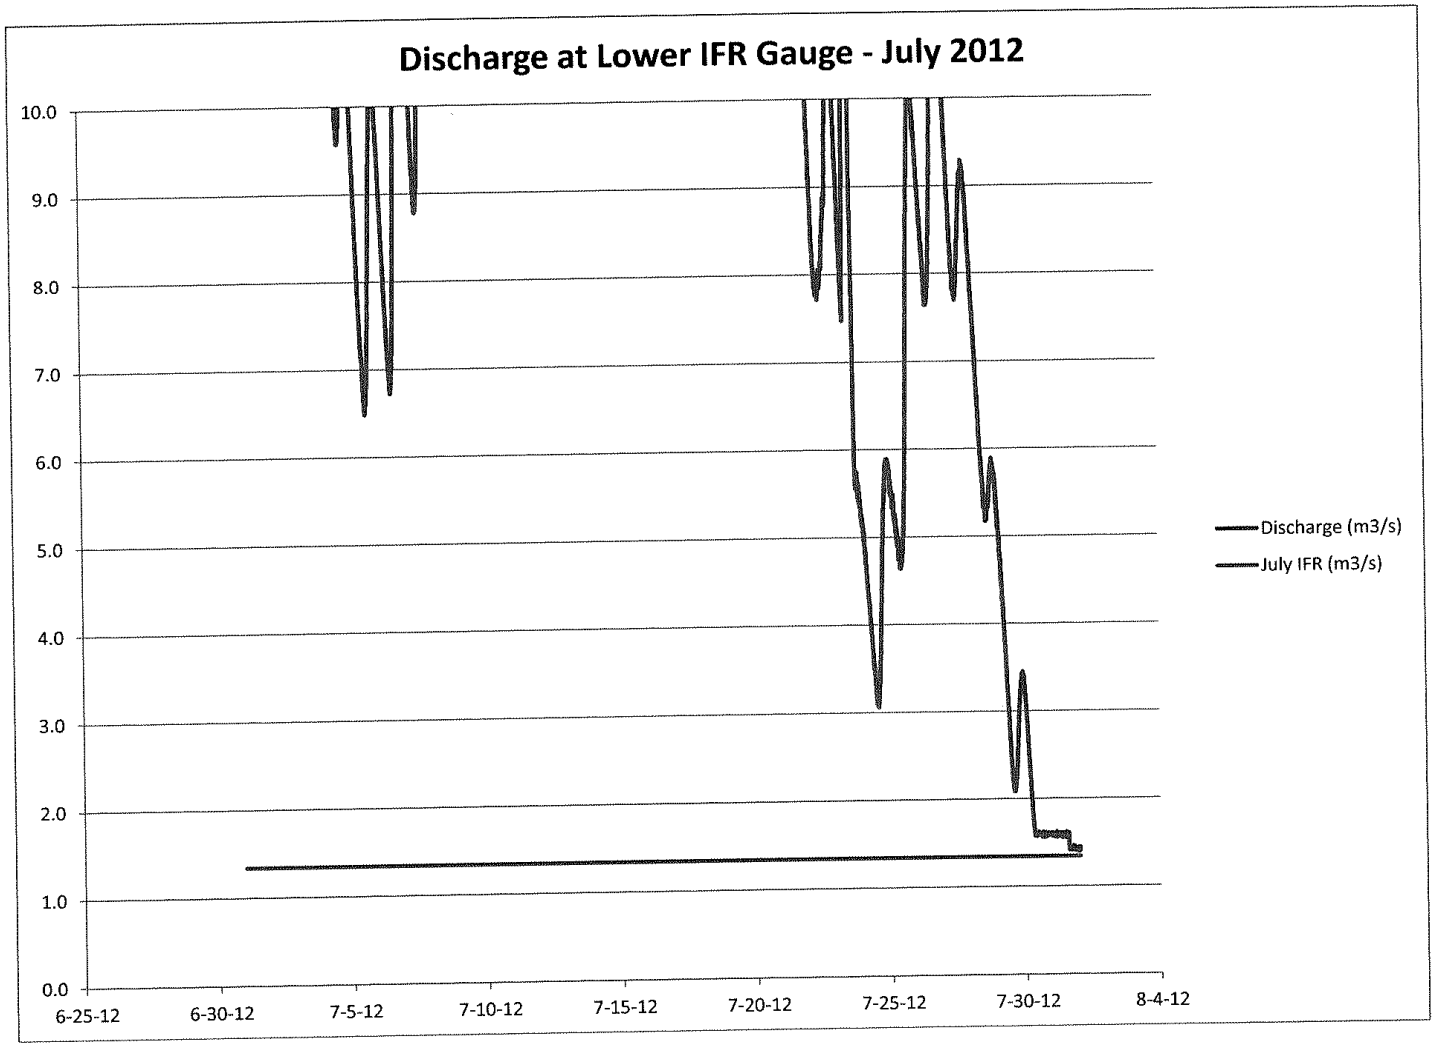
	14.63 m³/s. See attached Flow and Stage Data. 76 KE
Operational Changes	Ramping rates were decreased by 10% from ramping study levels to ensure future compliance.



July 23rd start up: ramping rates as measured at the compliance gage LIFR were temporarily above compliance limits (-0.118 compared to 0.100 for a duration of 45 minutes starting at 17:10). The overall trend of the river flows during this time of the day was reducing flows and therefore contributing to the negative stage change, through an exact attribution is difficult due to the sensitivity of the numbers and the marginal exceedance of the compliance limit. In order to reduce possible errors in the process of distinguishing ramping caused by the unit and by natural flow changes, the programmed ramping rates were reduced by 10% effectively August 3, 2012.



Sincerely,



Robert Kulka
Operations Manager

2012-07-23 16:05	0.926	8.74	-0.139

Though the flow in the creek is below 79% of MAD at this time, the ramping calculation is basing these numbers on changes in stage made while the river flow was greater than 79% MAD. No increases to plant flow were made from 15:40 to 16:10, and there was less

2012-07-23 16:10	0.918	8.61	-0.104			than 1 cm of river stage change between 15:40 and 16:40.
2012-07-23 16:15	0.911	8.49	-0.102			ie the stage change in the river after flow dropped below
2012-07-23 16:20	0.89	8.14	-0.123			79% MAD was less than 0.1 m/h.
2012-07-23 16:25	0.888	8.11	-0.133			
2012-07-23 16:30	0.886	8.08	-0.131			
2012-07-23 16:35	0.882	8.01	-0.114			
2012-07-23 17:10	0.814	6.95	-0.104	0:45	-0.118	Automated ramping up at rates confirmed by Ramping
2012-07-23 17:30	0.773	6.34	-0.113			Study; partly due to natural decrease in river flow.
2012-07-23 17:35	0.777	6.39	-0.105			
2012-07-23 17:40	0.76	6.15	-0.111

Subject: RE: Ramping Violation at Lamont

Thanks John for clarifying that the stranding search was only undertaken in the tailrace.

As I indicated previously, the only way to confirm no stranding and/or kills is to search and salvage when the areas are dewatered.

Fish will use as much of the channel as they are able, even during the winter, and the lower diversion reach once experiences higher flows once the previously diverted flow reach there. If fish move into newly watered areas when flows area higher in the lower diversion, then they can be stranded when flows recede back down after start-up.

Erin

Hi Erin

Thanks for your question

A shutdown of the plant creates a potential stranding event downstream of the plant. The diversion reach (upstream of the plant) would experience an increase in flow from the plant shutting down which is not considered a stranding risk. Therefore, the stranding risk is only downstream of the plant.

While it is possible that a stranding did occur, we do not believe it is appropriate to assume that it likely occurred. As you may know, the short section of creek between the powerhouse and the confluence of Upper Stave is very confined. The ramping threshold tests (for shutdown)at Lamont confirmed this. Furthermore, we understand that at this time of year the fish tend to deeper pools. More to the point, the report (we hope) provides a candid assessment of what occurred and what actions were taken without speculation either way. We deliberately and honestly advised that the inspection of the downstream reach was limited to observations from the tailrace due to winter conditions and safety concerns. I'm sure you would not advocate that we report otherwise.

Sincerely,

John D. Miller, P.Eng.

Subject: RE: Ramping Violation at Lamont

Lamont Creek has fish use for a distance upstream of the tailrace as well as downstream to its' confluence with the Upper Stave. The system supports blue listed bull trout. I don't believe that there would have been backwatering from the Upper Stave that would have mitigated the effects of a shutdown if that's what you are suggesting. Please explain within your incident report how this mitigation could have occurred as you have stated below. An hour without water would kill fish, which don't move very quickly at this time of year.

Please also indicate within the report how no stranding could have been observed if no thorough search was conducted. Please confirm the degree to which any search was conducted. It would be more appropriate to assume that fish stranding and likely kills did occur. The objective of the search and salvage is to confirm otherwise.

Sincerely,

Erin Stoddard, R.P.Bio.

Subject: Ramping Violation at Lamont

Hi Jim

On Saturday February 4th we had an emergency shutdown of Lamont G.S. The PLC controlling the plant became unresponsive. The Operators were able to restore the plant within an hour of the shutdown.
As you may be aware, the proximity of Lamont Powerhouse to the Stave River mitigates the impact for stranding below Lamont Powerhouse. Although a thorough stranding search was not possible due to winter access limitations, no stranding was observed.

We apologise for the delay in submitting this report. If you should have any questions, please do not hesitate to contact us.

Therefore, the stranding risk is only downstream of the plant.

While it is possible that a stranding did occur, we do not believe it is appropriate to assume that it likely occurred. As you may know, the short section of creek between the powerhouse and the confluence of Upper Stave is very confined. The ramping threshold tests (for shutdown)at Lamont confirmed this. Furthermore, we understand that at this time of year the fish tend to deeper pools. More to the point, the report (we hope) provides a candid assessment of what occurred and what actions were taken without speculation either way. We deliberately and honestly advised that the inspection of the downstream reach was limited to observations from the tailrace due to winter conditions and safety concerns. I'm sure you would not advocate that we report otherwise.

Sincerely,

John D. Miller, P.Eng.

Subject: RE: Ramping Violation at Lamont

Lamont Creek has fish use for a distance upstream of the tailrace as well as downstream to its' confluence with the Upper Stave. The system supports blue listed bull trout. I don't believe that there would have been backwatering from the Upper Stave that would have mitigated the effects of a shutdown if that's what you are suggesting. Please explain within your incident report how this mitigation could have occurred as you have stated below. An hour without water would kill fish, which don't move very quickly at this time of year.

Please also indicate within the report how no stranding could have been observed if no thorough search was conducted. Please confirm the degree to which any search was conducted. It would be more appropriate to assume that fish stranding and likely kills did occur. The objective of the search and salvage is to confirm otherwise.

Sincerely,

Erin Stoddard, R.P.Bio.
Ecosystems Biologist

Subject: Ramping Violation at Lamont

Hi Jim

On Saturday February 4th we had an emergency shutdown of Lamont G.S. The PLC controlling the plant became unresponsive. The Operators were able to restore the plant within an hour of the shutdown.
As you may be aware, the proximity of Lamont Powerhouse to the Stave River mitigates the impact for stranding below Lamont Powerhouse. Although a thorough stranding search was not possible due to winter access limitations, no stranding was observed.

We apologise for the delay in submitting this report. If you should have any questions, please do not hesitate to contact us.

Regards,

John D. Miller, P.Eng.

Cc: Davies, James W FLNR:EX; Robert Kulka; Jim Hinrichs; Amit Bhargava; Linda Vaughan
Subject: Furry Creek Power - Ramping Report
Attachments: image001.png

Aman,

On behalf of Furry Creek Power, I wanted to inform you of a ramping non-compliance that occurred on March 12, at approximately 9:30 AM. The event was caused by a line fault that initiated an emergency plant shutdown. It is likely that the high winds observed yesterday were a factor. The table below shows the event with hourly data provided by Romcomm, and compares ramping rates observed to the target ramping rates at the IFR gauge based on the ramping table in the Furry Creek OPPR.

Date/Time	Stage(m)	Flow(m3/s)	Ramping Rate (m/h)	Target Ramping Rate (m/h)
12/03/2012 10:01	0.627	0.540126	0.109	0.100
12/03/2012 11:01	0.774	1.199571	0.147	0.110
12/03/2012 12:01	0.671	0.636744	-0.103	-0.100

The negative ramping rate observed between 11 am and 12 pm was a result of the plant being restarted. Operational flow ramping rates during startup will be investigated to determine if changes are necessary to maintain target stage ramping rates in the creek. Please let us know if you have further questions.

Sincerely,

Kyle Edwards, BASc, EIT
Operations Engineer

Subject: Furry Creek Power - Ramping Report
Attachments: image001.png

Aman,

On behalf of Furry Creek Power Ltd., I wanted to inform you of a ramping event that occurred yesterday, June 28.

A modified manual trashrack cleaning technique was being tested, that proved to be much more effective than expected. Debris blocking the flow of water into the penstock was removed from the fine trash rack, which caused an increase in water diversion, and an associated decrease in diversion reach flow. The maximum ramping rate at the IFR gauge was approximately -0.1299 m/h compared to our target ramping rate for this flow of -0.1000. 5 minute data from the control system is provided underneath:

Date	Time	Stage (m)	Ramping Rate (m/h)
06/28/12	12:35:00	0.64332	-0.11414
06/28/12	12:40:00	0.63461	-0.11141
06/28/12	12:45:00	0.626492	-0.12607
06/28/12	12:50:00	0.627521	-0.11576
06/28/12	12:55:00	0.621695	-0.1299
06/28/12	13:00:00	0.62926	-0.11469
06/28/12	13:05:00	0.627881	-0.12031
06/28/12	13:10:00	0.62521	-0.12135
06/28/12	13:15:00	0.629755	-0.11424

The effectiveness of this technique is now known, and proper precautions will be taken to avoid similar occurrences in the future. FCPL is currently procuring and automated trash rack cleaner in order to reduce manual trash rack cleaning. The expected installation date is in September 2012. The cleaner is designed to engage as soon as there is a noticeable trash rack differential typically caused by debris. This will prevent the accumulation of debris and required down-ramping of diverted flows during accumulation and subsequent up ramping of diverted flows after removal of larger amounts of debris which caused the current event.

The stage change data will be analyzed in the impact assessment under the 2012 OEMP works. Please let me know if you have any further questions regarding this event.

Regards,
Robert Kulka

Aman,

On behalf of Furry Creek Power Ltd., I wanted to inform you of a ramping event that occurred on July 25, 2012. At approximately 4:50 pm pressure was lost in the HPU due to the failure of a pressure relief valve. This caused an emergency shutdown which led to up-ramping at the IFR gauge at a maximum rate of approximately 0.5 m/h, for a total duration of approximately an hour.

The issue was fixed as quickly as possible and the unit was ramped back up slowly and without issues approximately 2 hours later. Though the hydraulic pressure relieve valve which was the root cause of the incident is now functioning properly, it will be replaced with a new unit within the next few weeks.

Please contact Robert Kulka or me with any questions or concerns.

Sincerely,

Kyle Edwards, BASc, EIT

Re: Supplemental Fisheries Monitoring at Furry Creek

This memo provides a brief update on progress and methods for the supplemental environmental monitoring being undertaken by PGL at the Furry Creek hydroelectric projects operated by Furry Creek Power Ltd. The work is being undertaken as described in the work program submitted to MFNLRO for review on February 16, 2012[1] and approved via e-mail on March 19, 2012.

Fisheries fieldwork commenced in May 2012 with reconnaissance surveys used to determine site selection for subsequent work, and to evaluate whether electrofishing would be a reliable method of abundance estimation. Electrofishing sampling was attempted, but due to low conductivity, effectiveness was well below what would be required to obtain meaningful abundance estimates. Alternate approaches have been reviewed in order to find the approach that best meets the objectives of the monitoring program. The study design (Section 3.1.2) noted that if methods were to be changed, an update would be provided to MFLNRO staff.

In order to meet the data collection requirements for fish abundance, condition and life history, we propose the following modification to the methodology:

- A minimum of five sites will be selected within the diversion reach and the control reach where natural movement barriers (cascades, debris barriers, etc.) limit the ability of fish to redistribute. Fisheries site cards will be filled out for all sites.
- Each site will be intensively trapped with baited minnow traps during the previously identified time windows during periods of stable flow.
- All captured Dolly Varden will be PIT tagged in addition to having biological data collected as identified in Section 3.2 of the study design. All fish will be released at their point of capture.
- Survey teams will return to the sample site after a short time (5–7 days) and re-trap the sites to assess whether marked fish have moved and if unmarked fish have migrated into the sites. All unmarked fish will be bio-sampled as described in the study design.

These methods will still allow for abundance estimation at the habitat unit scale, while providing fairly definitive information on within-season and between-season movement of resident fish. This outcome is consistent with the overall study objective, to interpret project operations in terms of potential benefits or impacts to local fish ecology and habitat needs.

Please contact me at 604-895-7666 or tgray@pggroup.com with any questions or comments on this matter.

[1] Supplemental Environmental Monitoring Study Design: Furry Creek Hydroelectric Project. Version 1.0. Prepared by Pottinger Gaherty Environmental Consultants, file 2047-00.07.

Ullah, Aman FLNR:EX

2002494

From: Stoddard, Erin M FLNR:EX
Sent: Friday, July 13, 2012 3:35 PM
To: Ullah, Aman FLNR:EX
Cc: Babakaiff, Scott C FLNR:EX
Subject: RE: Furry Creek supplemental environmental monitoring - status update

The reason that the addition of electrofishing and/or snorkel swimming was recommended for supplemental sampling was because minnow trapping isn't an effective method alone for monitoring or assessing population health.

If stream conductivity is too low, then the consultants should've provided stream cards or a summary that indicated measured conductivity levels, electrofishing settings and efforts, and the ineffective catches to support their recommended changes to the program.

One of the outstanding questions for this project is whether there is a sustainable char population within the diversion reach, and whether there is spawning, incubation and early juvenile rearing in the reach. Though minnow trapping will be able to capture and assess some age classes in the population, it won't be able to monitor or assess the younger or older age classes.

As previously recommended by myself, if the claim can be supported that electrofishing isn't an effective methodology in this system through provided data, then snorkel swims should be adopted as a methodology into the program to supplement the minnow trapping efforts.

Please contact me if you would like to discuss any of the above.

Sincerely,

Erin

Subject: FW: Furry Creek supplemental environmental monitoring - status update

Hello,

PGL has provided supplemental environmental monitoring status update on Furry Creek IPP dated May 9, 2012 (attached) and proposed some modifications to fish abundance estimation methodology including switching from electrofishing as specified in study plan dated February 2012 (attached for ready reference) to baited minnow traps due to low conductivity. PGL has further stated that this outcome is consistent with the overall study objective, to interpret project operations in terms of potential benefits or impacts to local fish ecology and habitat needs.

So, wanted to check with you folks if the modification(s) is acceptable or otherwise.

Thanks,

Aman

Subject: RE: Furry Creek supplemental environmental monitoring - status update

Hi Aman,

Thank you for the reply. Sorry for the delay in getting back to you. I have provided some additional documentation with consideration to Erin's comments. Site cards, fishing effort, water quality details, capture results, etc. will all be included in formal project reporting, but I have also added those details where pertinent in the additional info below.

Electrofishing Details:

Reconnaissance fisheries surveys were undertaken at Furry Creek on May 7 and 8, 2012. Surveys were led by associate fisheries biologists Jason Ladell, R.P.Bio. and Don McCubbing, R.P.Bio. The objectives, as described in our work program, were to identify monitoring sites and to establish whether electrofishing will be a valid and useful method to support the broader objectives of the study.

The survey team first entered the stream at the headpond and moved upstream for 300 m from the intake. The creek here is moderately high gradient with boulder-dominated substrate. A key observation of the reconnaissance surveys was that proper enclosures for multiple-pass electrofishing removal enumeration is problematic in this reach of river, even at lower flows. The entire diversion reach was walked to establish repeatable sampling sites. As noted in previous reports, the diversion reach is cascade-pool morphology. The middle 2 km of this ~3.1 km diversion reach is very steep and confined, with the pools between cascades providing virtually the only available fish habitat.

Electrofishing was conducted at 11 sites across the diversion reach and the section upstream of the intake. Equipment included a Smith-Root LR-24 electrofisher and a small circle anode. Settings ranged from 500 to 800 V, 20 - 40 W, and a 12% duty cycle to DC current Sites were fished in an upstream direction, with one person trailing the fisher on the downstream side with a dip net to capture fish that may have been stunned and drifting. At all sites but one, there were no fish captured or even seen being spooked away. At one site (on the right margin of the creek, shortly upstream of the powerhouse), one juvenile Dolly Varden and one *cottid* sp. were seen but weren't able to be captured before swimming away. This one sighting involved rather high voltage settings (745 V).

The hand-held conductivity meter was not functioning properly at the time of the surveys, however the LR-24 model has a "Quick Set Up" option that allows the setting to be automatically tailored to the conductivity. Previous OEMP monitoring by TRC Consulting at Furry Creek has reported conductivity less than 10µS in 2005, 2006, and 2007. A check at the Highway 99 bridge crossing last week measured 13µS. Conductivity of greater than 30µS is typically required to make electrofishing a useful enumeration technique. The results from the reconnaissance surveys in May 2012 suggest that this low conductivity was accurately reported and still exists. Subsequent field work will include conductivity measurements for completeness of reporting. Regardless, the further use of electrofishing for this program was not recommended by the assessing field biologists based on:

- the inferred very low conductivity will lead to very low capture rates and under-reporting of abundance;
- the boulder habitat makes it problematic to fully isolate fishing sites, and to properly conduct removal passes since the cover habitat beneath the boulders (where Dolly Varden largely reside) is not reachable with the fishing pole;
- similarly, within the diversion reach many of the pools are too deep to electrofish except at the pool margins.

Alternate Methods:

Erin's comments are appreciated and we agree with his sentiments on the key objectives of the monitoring program. The use of minnow trapping is a useful but not optimal method for abundance estimation and age class sampling, and it is true that it carries a size selectivity bias. However, in the opinion of the assessing field biologists from the May work, as well as my own opinions from fisheries work at the site in 2010 and the results reported by Tom Cleugh for 2004-2008, the habitat in Furry Creek does not support large Dolly Varden and a fully grown adult is unlikely to exceed ~220mm, with most adults expected to fall in the 130 to 180mm range. This size range is not unusual for nutrient poor systems, and is

well within the size range for minnow trap capture. As a result we do feel that we will be able to collect representative samples of older age classes with this method. The Dolly Varden habitat provided by the diversion reach is predominantly pools, many of which are separated on upstream and downstream sides by cascades that range from minor obstructions to potentially full barriers for small char. It is therefore reasonable to expect that intensively minnow trapping a given pool-dominated site is likely to result in similar capture efficiency as electrofishing would have with more favourable conductivity.

For the very young age classes, it is true that young-of-year juvenile Dolly Varden are unlikely to be captured with minnow trapping. In our experience, capture of young-of-year Dolly Varden even under optimal electrofishing conditions is also quite rare in this sort of low-productivity system. However, an alternative to direct capture or observation of early juvenile fish an indirect method of targeting adult residency and/or spawning in the diversion reach. The alternative methods proposed do provide a powerful approach for evaluating life history use. Because fish will be implanted with unique PIT tags during each sampling event, detection with a portable antenna during subsequent monitoring will indicate whether fish are largely residents of particular territory or if they typically migrate downstream through the diversion reach, as was inferred by the TRC Consulting OEMP reports. Use of PIT tag antennae after the first rounds of minnow trapping (e.g. once there are already tagged fish in the system) will also provide some information on minnow trap efficacy.

The use of snorkel surveys to infer life history usage has been considered and is in fact already part of the work program described in the Study Plan. It is a method planned for use only during the winter (~mid November, weather permitting) surveys. The use of snorkel surveys for this particular period was chosen to improve the probability of detecting spawning fish or active redds, if present, since that is the appropriate time of year for Dolly Varden. It was also chosen because enumeration work is not being undertaken in winter (as the study plan presumed the winter conditions would not be conducive to electrofishing). The revised methods will, however, allow detection of previously tagged fish, if present. This will provide key information about the seasonality of use and migration within or through the diversion reach, and by extension will provide additional understanding of potential use for spawning and young juvenile rearing. Snorkeling can be a useful tool for verifying fish presence, life history usage, and in some cases is also quite reliable for abundance estimates (though that is not the case for this habitat). Given the anticipated outcomes of the revised methods, we do not feel that additional snorkel surveys beyond what is already planned will substantially improve the conclusions of the study. If subsequent work indicates that more snorkel surveys will aid our understanding of early juvenile presence and use, we propose then augmenting the methods accordingly, in consultation with your Ministry.

I hope that this provides you with sufficient additional documentation. Please get in touch if you would like to discuss further.

Subject: RE: Furry Creek supplemental environmental monitoring - status update

Hi Tyler,

Thank you for providing the status update on the supplemental environmental monitoring program at Furry Creek (e-mail below & the attachment)!

Our ecosystems staff (Erin Stoddard) had a quick look at this and commented as below:

"The reason that the addition of electrofishing and/or snorkel swimming was recommended for supplemental sampling was because minnow trapping isn't an effective method alone for monitoring or assessing population health.

If stream conductivity is too low, then the consultants should've provided stream cards or a summary that indicated measured conductivity levels, electrofishing settings and efforts, and the ineffective catches to support their recommended changes to the program.

One of the outstanding questions for this project is whether there is a sustainable char population within the diversion reach, and whether there is spawning, incubation and early juvenile rearing in the reach. Though minnow trapping will be able to capture and assess some age classes in the population, it won't be able to monitor or assess the younger or older age classes.

As previously recommended by myself, if the claim can be supported that electrofishing isn't an effective methodology in this system through provided data, then snorkel swims should be adopted as a methodology into the program to supplement the minnow trapping efforts".

So, provide us a supporting documentation for the proposed modification to the monitoring program for our concurrence.

Regards,

Aman

Subject: Furry Creek supplemental environmental monitoring - status update

Hello Aman,

Please find attached a brief update on the environmental monitoring program being undertaken at Furry Creek. It describes the results of the reconnaissance work done in May, and the amendments to the methods we have proposed for subsequent work.

Please contact me with any questions or concerns.

Regards,

Tyler Gray, B.Sc., M.R.M., R.P.Bio.

Subject: Furry Creek Power - Ramping Report

Aman,

On behalf of Furry Creek Power Ltd., I wanted to inform you of a ramping event that occurred on July 25, 2012. At approximately 4:50 pm pressure was lost in the HPU due to the failure of a pressure relief valve. This caused an emergency shutdown which led to up-ramping at the IFR gauge at a maximum rate of approximately 0.5 m/h, for a total duration of approximately an hour.

The issue was fixed as quickly as possible and the unit was ramped back up slowly and without issues approximately 2 hours later. Though the hydraulic pressure relieve valve which was the root cause of the incident is now functioning properly, it will be replaced with a new unit within the next few weeks.

Please contact Robert Kulka or me with any questions or concerns.

Sincerely,

Kyle Edwards, BASc, EIT
Operations Engineer

Event Description

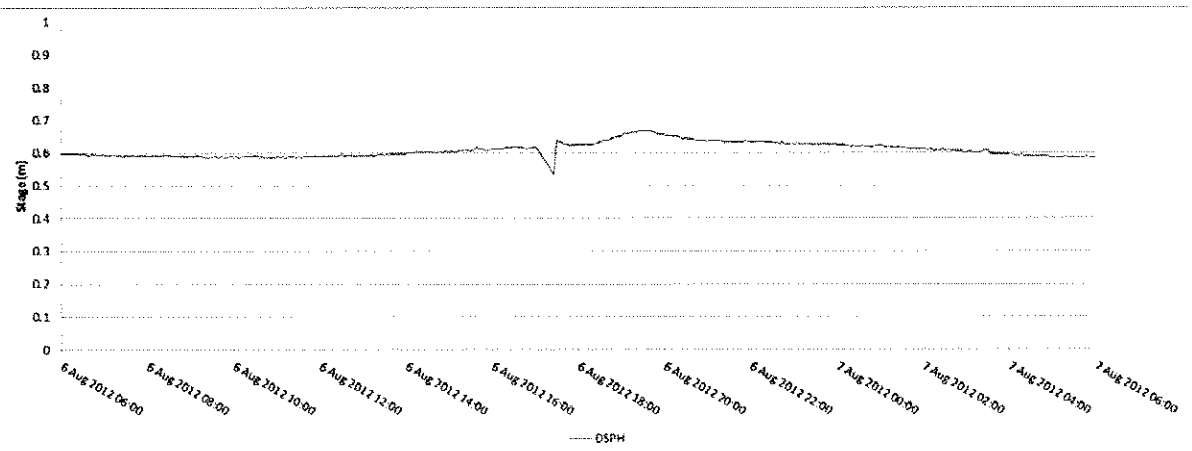
Date:	6 Aug 2012	**Time:**	17:30
Event Type:	Ramping		

- Lightning struck the BC Hydro transmission line near Whistler triggering a transfer trip of the Fitzsimmons facility.
- The lightning strike tripped circuit breakers, damaged the facility's inverter and caused the plant control system to shut down.

Response & Mitigation

- Ecofish Research Ltd. was dispatched to the site and conducted a stranding search at the sensitive sites.

Environmental Impact & Assessment



- No stranded or distressed fish were observed during the stranding searches conducted by Ecofish.
- The stage change observed downstream of the powerhouse was -0.08 m (0.62 m to 0.54 m). Refer to Figure 1.

Preventative & Corrective Measures

- The lightning damaged plant equipment was replaced.

Event Description

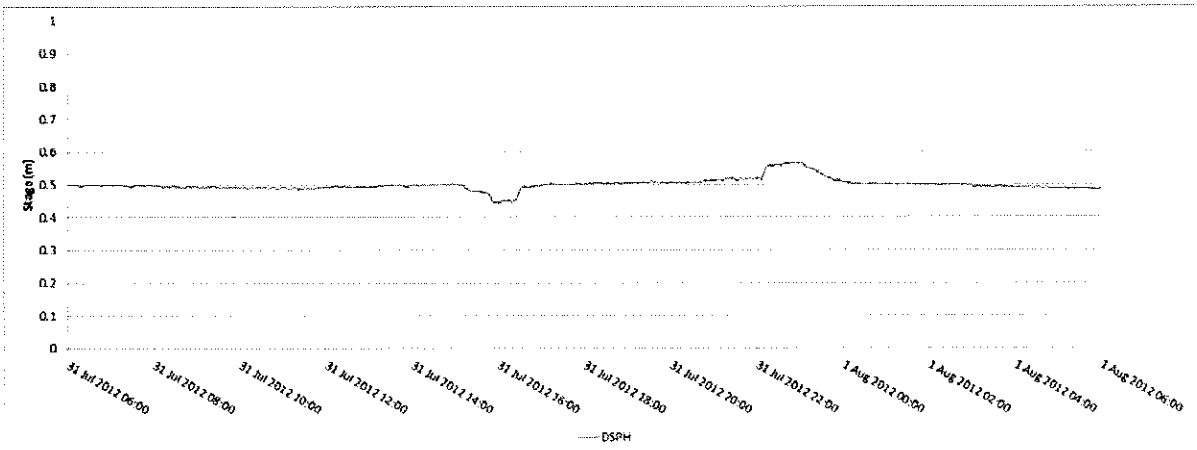
Date:	31 Jul 2012	**Time:**	15:54
Event Type:	Ramping		

- The operations team was performing maintenance work in the control system building at the intake.
- There was a communication fault between the instrumentation at the intake and the plant control system at the powerhouse which initiated a shutdown of the generating equipment.

Response & Mitigation

- Ecofish Research Ltd. was dispatched to the site and conducted a stranding search at the sensitive sites.
- The operations team manually controlled the plant to mitigate the effect of the shutdown.

Environmental Impact & Assessment



- No stranded or distressed fish were observed during the stranding searches conducted by Ecofish.
- The stage change observed downstream of the powerhouse was -0.05 m (0.50 m to 0.45 m). Refer to Figure 1.

Preventative & Corrective Measures

- Reviewed the plant control system to optimize the conditions when a shutdown is initiated.

I just had a look at the WSC gauge data, and it looks like there were two separate ramping events.
Will you be reporting on each of them?

Event Description

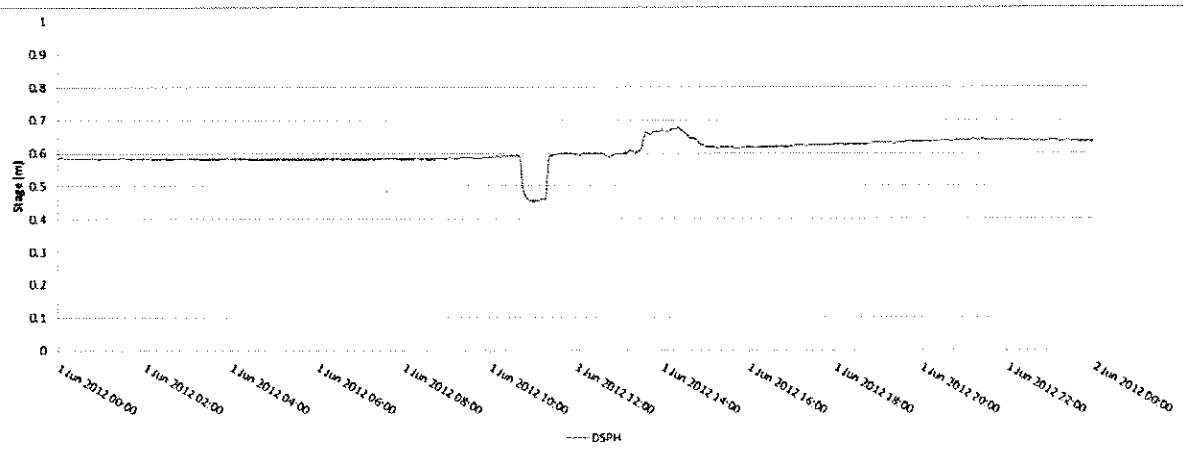
Date:	1 Jun 2012	**Time:**	10:45
Event Type:	Ramping		

- The generator entered an over voltage condition which initiated a controlled shutdown of the generating equipment.
- During the shutdown, the maximum turbine speed set point was exceeded causing the turbine inlet valve to close.
- Closure of the turbine inlet valve resulted in a ramping event downstream of the powerhouse.

Response & Mitigation

- Ecofish Research Ltd. was dispatched to the site and conducted a stranding search at the sensitive sites.
- An Innergex contractor logged into the plant control system to verify the generator excitation settings and the generating facility was restarted.

Environmental Impact & Assessment



- No stranded or distressed fish were observed during the stranding searches conducted by Ecofish.
- The stage change observed downstream of the powerhouse was -0.14 m (0.59 m to 0.45 m). Refer to Figure 1.

Preventative & Corrective Measures

- The maximum turbine speed set point was optimized to extend the period of time before the turbine inlet valve is closed.

Event Description

Date:	17 April 2012	**Time:**	15:30
Event Type:	IFR		

- The Fitzsimmons generating facility has not been operating for the majority of 2012 due to low creek flows and scheduled maintenance.
- The facility was started on 17 April 2012 to check the modifications to the intake structure and the maintenance performed on the generating equipment.
  - The instream flow briefly dropped below the minimum instream flow release during the check.

Response & Mitigation

- The facility was shut down and the minimum instream flow was re-established.

Environmental Impact & Assessment

- One of the modifications to the intake structure was the addition of an engineered outlet that was designed to pass a minimum of 0.1 cms. The downstream intake gauge indicated a flow of less than 0.1 cms for approximately 75 minutes (Figure 1). The stage discharge relationship will be improved so that it more closely matches the engineered outlet flow.
- The instream flow at the Ziptrek bridge (Ziptrek) was less than 0.4 cms for approximately 60 minutes (Figure 2).

Preventative & Corrective Measures

- Improve the stage / discharge relationship at the intake and Ziptrek gauges to accurately represent the flow in Fitzsimmons Creek.

- Continue to monitor instream creek flow and adjust the plant flow accordingly.

Hi Scott

I think there is only one non-compliance report outstanding and it should be submitted shortly.

The annual compliance reports were submitted to Jim Davies. Due to the size of the raw data files they were submitted separately on CD.

Regards,

John D. Miller, P.Eng.

Folks,

Two points:

1. There have been several non-compliances at Innergex facilities in recent weeks, and I was informed that detailed reports would be forthcoming, but I've yet to see any. Have they been submitted, and if not, when are they expected to be submitted?
2. It is my understanding that the 2011 OPP Compliance Reports were due for all the Innergex facilties as of March 31 2012, but I've yet to see any of these reports. Again, have they been submitted, and if not, when are they expected to be submitted?

Mr. Davies,

Please be advised that on 17 April 2012 there was an IFR event at the Fitzsimmons generating facility.

A detailed report will be forwarded once the data has been compiled and analyzed.

Event Description

Date:	16 Feb 2012	**Time:**	20:30
Event Type:	IFR and Ramping		

Background

- IFR flow is calculated using one of two different methods depending on the stage reading downstream of the intake. The stage is determined using an Ohmart level indicator.
  - During low flow, the IFR is calculated using the downstream level indicator and the stage discharge relationship.
  - During high flow, the IFR is calculated using the upstream level indicator. The IFR is calculated as the difference between the creek flow and the plant flow.

Event

- At approximately 17:00, the PLC began unexpectedly switching between the two calculation methods.
- The PLC generated a Low IFR warning alarm. The Operator acknowledged the alarm and checked the IFR; it was above the licence requirement.
- The PLC generated a Ramping warning alarm. The Operator acknowledged the alarm and adjusted the plant flow to increase flow in the diversion reach.
- At approximately 20:15, the PLC became unstable and increased plant flow.
- The Operator activated the emergency stop at 20:20 to shut down the generators.
- The rapid increase in plant flow caused a temporary IFR flow reduction in the diversion reach. (Figure 1)
- The emergency shutdown caused a ramping incident downstream of the plant. (Figure 2)

Response & Mitigation

- The Operator immediately contacted the VP – Operations and Maintenance (VP) to assist with troubleshooting the event.
- The Operator rebooted the PLC and the HMI computer was also rebooted.
- The VP was able to remotely log into the HMI and discovered, and corrected, an error in the PLC.
- The PLC was forced to use the upstream creek flow calculation and the IFR setpoint was set conservatively high and the plant re-started
- The water level indicator (Ohmart Vegapulse) downstream of the intake was inspected after observing that the output was flat lined at 20 mA.
    - The operators discovered a loose connection and water in the junction box. Both of these conditions caused erroneous values to be transmitted to the PLC.
    - The erroneous stage inputs to the PLC produced an error that was propagated through the PLC, causing the instability and forcing the unplanned shutdown of the facility.

Environmental Impact & Assessment

- The stage change observed downstream of the intake was -0.07 m (0.24 m to 0.17 m) for approximately two hours. Refer to Figure 1.
- The stage change observed downstream of the powerhouse was -0.16 m (0.56 m to 0.4 m) for approximately 3 hours. Refer to Figure 2.
- An instream assessment was not conducted; the variance was detected and restored after dark which prevented onsite personnel from safely accessing the diversion reach.

Preventative & Corrective Measures

- The downstream level indicator was cleaned, connections inspected, sealed and put back into service.
- Similar level indicators are installed at the Douglas, Tipella and Stokke facilities.
    - The Douglas and Tipella level indicators were inspected; no issues were found.
    - The Stokke indicator will be inspected in the near future.
- Review the PLC program for instances where a similar erroneous number could be created and determine what precautions can be implemented to prevent a recurrence.
