Subject: FW: Request for review - R7B Moose regulation change proposal
Attachments: R7B_2022-Moose from GOS to LEH_Bridger.docx; Moose population and hunting efforts summary_Bridger.docx; Copy of Draft Population estimates- Moose Survey Summaries Peace Region_Bridger.xlsx; MOOSE Harvest Tracking.xlsx

Hey gents,

I had a quick look at the moose LEH proposal package that was sent out for review. The management team here was not willing to send it to me for some reason (as you saw in those emails, Burwash), but I was able to get my hands on some copies. I'm not sure what their concern was with sharing this information with me specifically, as it's all just based off of our regional moose data.

Anyhow, overall I did find the documents to be quite misleading. So I added quite a few comments that I think help tell the full story of the moose situation in our region here. s.13

s.13

I added quite a few comments to the two word documents, and to the one spreadsheet. I also included our regional moose harvest tracking spreadsheet, which I believe helps tell a more fulsome story.

Let me know if you'd like to discuss at some point.

Cheers,

Mike

Mike Bridger, M.Sc., R.P.Bio.

3. Map associated with the proposed regulation. ☐ Yes ☒ No

- This map may be used to form the regulation. It should be digital and professional. Please provide shapefiles if available.

4. Reason for proposal (rationale in plain language): IMPORTANT – this is what goes on the public engagement website (AHTE) verbatim

Moose populations are stable to declining across most of the Northeast Region. Stakeholders and First Nations are concerned about the populations ability to support First Nation sustenance harvest, licenced harvest, and non-consumptive values due to the pressures of landscape changes and hunting practices. A series of regulation changes were implemented to reduce licenced moose harvest during the last 6 years; moose populations do not appear to be stabilizing with these changes. Addressing habitat concerns is a long process and industry specific; moving moose from General Open Season to Limited Entry Hunt is intended to maintain moose harvest opportunity while providing more oversight of the number of moose harvested within the Region. Changing part of the Northeast Region to LEH while keeping other areas GOS risks moving hunters into areas with lower hunting pressure and increasing moose harvest in currently stable populations. The Youth LEH season is intended to provide opportunity for youth to harvest moose before returning to school and having reduced opportunity during the remaining seasons. The two LEH opportunities (September 1 – September 30 and October 16 – October 31) are intended to balance harvest pressure before and after the rut to support reproductive success; the number of authorizations can be adjusted to maintain post-hunt bull to cow ratios. All three LEH opportunities are Any Bull to distribute harvest pressure across the different age classes and offset loss of harvest opportunity by increasing the number of moose that could be legally harvested.

s.13

PART B: ANALYSIS

1. Describe surveys used for conservation issues and their results as they relate to this submission:

s.13

Moose inventory data in the Northeast Region does not have the required frequency or coverage to estimate population trends for most of the management units. The recent inventories (2015-2021), demographics, and densities were calculated for each management unit and extrapolated into management units that do not have current inventory data using available information within each Game Management Zone. The result of this work indicates the Northeast Region has 60,660 moose (minimum 47,705 and a maximum of 73,615 moose); the Northeast Region contains an estimated 16,307 (12,406 – 20,208) bulls, 33,257 (26,375 – 40,140) cows, and 11,094 (8,923 – 13,266) calves).

Work completed by Kuzyk and colleagues in 2018¹ modelled moose population trends across the Province and found each Northeast Game Management Zone has a decreasing population trend ($\lambda < 1$) between 2006 and 2015; a change from the 1996-2005 period where only one Game Management Zone had a declining population trend. This perspective is supported by all the Northeast Region's First Nations who have indicated moose populations are decreasing and harvesting is becoming challenging. Declining hunter effort in the Big Game Harvest Survey is likely a hunter response to declining moose populations and declining success rates.

Research completed by Natcher and colleagues² in 2021 indicates First Nation communities harvest annually 2.1 – 2.4 moose per household. There is a minimum of 677 First Nation residences in the Northeast Region and an unknown number of households from transboundary First Nations (Kaska Daylu Council, Dene Tha' First Nation, Horselake First Nation, McLeod Lake Indian Band) that may hunt in the Region. Approximately 1,421 to 1,624 moose are harvested by First Nations assuming every household is actively harvesting moose and the estimate for households that don't harvest is balanced by harvest from First Nations bordering the Region. First Nations prefer to harvest bull moose to protect the cows and support a sustainable population; exceptions are made for dry cows since they did not successfully reproduce and would be harvested for sustenance purposes. The First Nation harvest distribution can be adjusted to 75% of the moose harvested are bull (1,066 – 1,218) and 25% of the harvest is are dry cows (355 – 406).

Licensed hunters harvested an estimated 1,489 moose in 2019. The combined licensed and First Nation subsistence harvest may be 2,910 – 3,113 moose annually (2,555 – 2,707 bull moose assuming First Nation bull harvest is 75% of the total First Nation harvest).

The Harvest Management Principles described in the Provincial Moose Management Framework suggest the maximum moose population growth of 15% occurs when wolf populations are controlled. A minimum of 32 calves per 100 cows is required to compensate for natural mortality. The maximum harvest rate suggested is 10-11% of the population when harvest is distributed across bulls, cows, and calves. First Nation subsistence practices favors harvesting bull moose and licensed harvest is restricted to bulls with further restrictions based on antler configuration. Even distribution across the population does not occur under the current cultural practices and regulatory requirements which requires a lower maximum allowable harvest rate to account for the selective harvest practices; a recommendation is 5% of the population (3,033 ± 348). The annual estimated combined harvest of licensed hunters and First Nations is approximately 4.9% (ranges from 4.1% to 6.3%) of the total population. This harvest rate requires higher calf recruitment of 30-45 calves per 100 cows to maintain stable populations.

Calf recruitment in the Northeast Region ranges from 7 calves per 100 cows (MU 7-57 in 2017) to 68 calves per 100 cows (MU 7-47 in 2016) with a regional average of 32 calves per 100 cows. The regional moose recruitment has remained in this range during the last 20 years. This recruitment level indicates regional moose populations are likely to continue declining under current the wildlife management practice. Changing to LEH may provide the Province the flexibility required to maintain the bull composition and slow the population declines while long-term measures are implemented to change the main population drivers.

Kuzyk and colleagues¹ publication indicates a maximum bull harvest of 20% would be sustainable for most moose populations in the Province. Based on the current population estimates, the Northeast Region could support the harvest of 3,261 (± 780) bull moose annually which is approximately equal to current harvest rates.

Local overharvesting is challenging to avoid through General Open Season since hunters have the flexibility to harvest moose based on hunter preference and access. Antler restrictions have not stabilized the moose populations; moving to Limited Entry Hunt provides the Province the ability to distribute harvest pressure across the Region to reduce the risk of overharvesting in certain areas. The proposed Any Bull LEH is intended to support hunters' opportunity to successfully harvest moose while addressing potential enforcement challenges and unlawful harvest encountered when hunters do not accurately count points on the antler.

The Any Bull LEH would distribute harvest pressure across more age classes rather than the current focused harvest on young bulls (spike-fork) or older bulls (tri-palm, 10 point).

Management Units 7-21B, 7-22, and 7-31B overlap the South Peace Caribou recovery efforts and wolf control zones. Keeping these Management Units as GOS will encourage moose harvest within the caribou recovery areas and slow moose population growth.

The Moose LEH Shared hunt allows family or friends to continue moose hunting together without increasing the number of authorizations issued to support the continuation of this practice and knowledge transfer to newer hunters.

¹ Kuzyk, G., I. Hatter, S. Marshall, C. Procter, B. Cadsand, D. Lirette, H. Schindler, M. Bridger, P. Stent, A. Walker, and M. Klaczek. 2018. Moose population dynamics during 20 years of declining harvest in British Columbia. *Alces* 54:101-119

² Natcher, D., S. Ingram, A-M. Bogdan, and A. Rice. 2021. Conservation and Indigenous subsistence hunting in the Peace River Region of Canada. *Human Ecology*. 49:109-120

2. Alternatives to regulation considered:

The Northeast Region has implemented more restrictive hunting regulations to address declining moose populations, but these have not generated the expected change.

Alternatives considered:

- Current regulation structure – moose populations have been declining for over 20 years. The current regulations have been inadequate to stabilize the populations.
- The calf recruitment is low across the Region and is inadequate to stabilize the population. The main driver behind low calf recruitment and survival is predation. Increasing the wolf bag limit to 10 has been proposed and not supported since licenced hunters currently can harvest 3 wolves annually and few hunters consistently harvest wolves. Increasing the limit is unlikely to have a direct, consistent, and sustainable benefit for moose.
- Implementing a predator control program in specific Game Management Zones to enhance calf moose survival. The Management Plan for Grey Wolf (*Canis lupus*) in British Columbia is clear (section 7.4) that implementing predator control to enhance ungulate populations for hunting is contrary to policy. Licenced hunting opportunities will need to be closed before this alternative can be considered.

3. Pros/Cons analysis undertaken & results:

Pros:

- Low calf recruitment indicates moose declines are likely to continue, LEH provides the ability to collect hunter success data and adjust LEH authorizations and quota before the maximum harvest declines below current harvest levels.
- First Nations requested the Province management moose under LEH; this is responsive to their requests
- Responds to First Nations' local and traditional knowledge regarding moose populations
- The Province will need to explicitly consider First Nation Treaty 8 right to hunt when making quota and LEH decisions
- The Province would be able to distribute harvest across the region and reduce the risk of localized overharvesting
- Regional staff and Branch have more control over moose harvest and can adjust LEH authorizations to support management objectives
- Precautionary approach for management units without current inventory data to reduce risk of moose becoming a species of conservation concern

Cons:

- LEH is unlikely to stabilize or increase the moose populations without addressing habitat and predation
- Licenced hunting community harvests moose for food. A moose provides approximately 200kg of meat for the cost of a hunting licence (\$32) and species licence (\$25). There are additional, variable costs associated with hunting – fuel, travel, accommodations, cut & wrap – that are harder to incorporate since this varies between hunters. Replacing 220kg of moose meat with 220kg of beef would cost approximately \$3,370³ using beef's 2020 weighted average of \$15.31/kg.
- Licenced hunters may be upset on the reduced opportunity.
- Northeast licenced hunters will have reduced opportunity under the current LEH system
- Updating the licencing system to include the new LEH codes will take time and resources
- Additional staff time to calculate annual LEH and quota recommendations
- First Nations may expect this change will stop or reverse moose population declines
- Decreased number of hunters traveling from other Regions to the Northeast for moose hunting
- Increased harvest pressure in the other Regions that have moose general open season

4. Identify risks of NOT implementing the new provision:

The risks associated with not implementing the regulation change could be the non-recoverable collapse of the moose population within the Peace Region. If the general open season continues to operate, the moose population may decrease past a recoverable population. Alternatively, it could lead to a recoverable population, that would require either a LEH or a closed season to allow the population to recuperate. This would also frustrate hunters and stakeholders.

If the government does not listen to the Traditional Knowledge of the local First Nations, there may be a potential violation of Treaty 8 rights, as the population of moose continues to decrease, and sustenance harvest is affected, a lawsuit may be initiated.

5. Comments by Reviewers: (if relevant)

Use separate page, as comments may not be included in the final OIC/MO Package.
Copies of email correspondence may be attached.

PART D: STAKEHOLDER CONSULTATION

ADEQUATE CONSULTATION AND ENGAGEMENT MUST BE RECORDED, OR THE FORM WILL BE RETURNED TO THE ORIGINATOR.

Please attach supporting documentation, such as letters, meeting minutes, etc.

Identify who was consulted and when consultations took place.

Who raised concerns and what was the nature of their concerns?

Has the regulation been changed to respond to Stakeholders' Concerns?

Standard thresholds used:

Densities: 200/1000 moose per km² above is high density below is low density marked by a black horizontal line on the uncorrected densities figures.

Sex Ratios: Bull: cow thresholds High density 50/1000 bull: cow and 30/1000 bull: cow indicated by a blue line on ratio figures; raw data indicated by blue circles. Calf: cow thresholds: high density: 30/1000 calf: cow and low density 25/1000 calf cow indicated by a red line on ratio figures; Raw data indicated by red triangles.

For both hunting efforts and hunted male black vertical lines indicate 1996 and 2006 implementation of SOFT and SOFT 10 respectively hunting regulation changes.

South Peace: Densities are near or below the low population threshold. Bull: cow ratios mostly above threshold hold for high densities population standard. Compared to Calf: cow ratios near or below the threshold limit for high population densities. Hunting efforts have been increasing since 2006 regulations changes, and male hunting pressure also increased substantially. With high hunting efforts and high male pressure, the change in regulations seems to affect hunting efforts, putting pressure on bulls. However, the bull: cow ratios remain just above the threshold for high population densities.

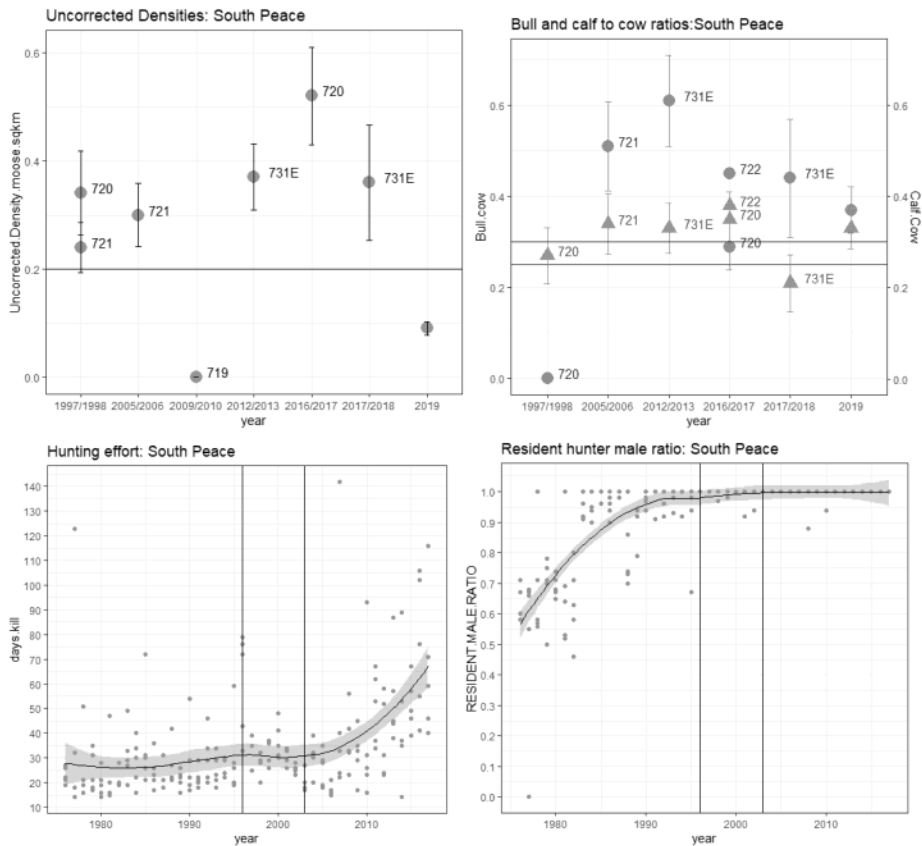

North Peace: High densities population with lots of data (though relatively high error estimates). Calf: cow remains above the high-density threshold, and bull: cow seems to border the threshold for high densities. Some MU's are only slightly above, and some are just under in recent survey reports. Hunting efforts have increased a lot since 2006 regulation changes and quite a few high outliers (above 70 days) since 2010. Male ratios since 2006 increased then remain high; however, not as stark as other regions. The male pressure seems to be slightly more favorable.

Northeast Rockies: Population densities seem to be declining dramatically since the early 2000s. However, this could be due to survey efforts and methodologies. I.e., the more recent surveys are more representative as there is lots of variability in the surveys from the 90s (also strictly from MU 7-42). The 2000s surveys seem to have low error estimates. The densities border around the threshold, so this region was labeled as low density. Calf: cow ratios are well below the threshold and should be a reason to investigate further. Bull: cow border the threshold in recent years depending on MU surveyed. Hunting efforts and male ratios are increasing since the 1996/2006 regulation changes, suggesting pressure on the bull populations.

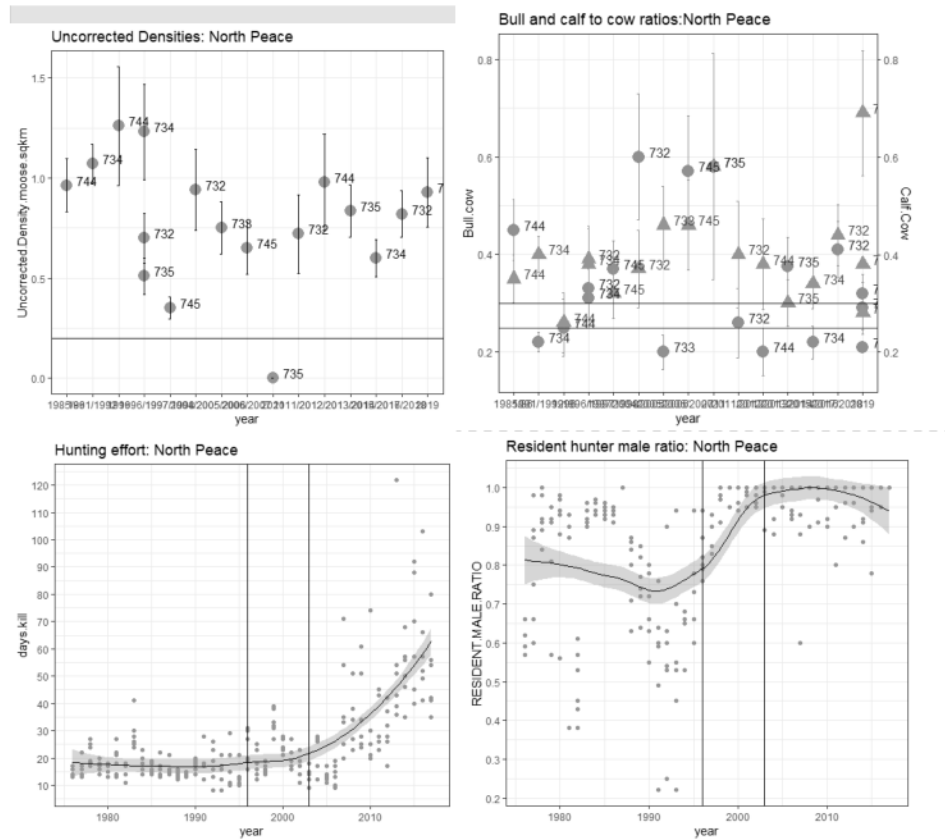

Liard: Density data is sparse, and surveys have high variability. Population estimates are not specific. Bull: cow ratios are above the Calf: cow ratios and above the thresholds. Calf: cow ratios are all on the threshold. However, the data is not ideal. Hunting efforts have lots of variabilities. They seem to be increasing since the 1996/2006 regulation changes but not as dramatically as other regions. Male ratios are high. A few outlier n/a data is skewing the more recent results in the male hunting ratios.

Fort Nelson: Low density populations. Calf: cow ratios are below the threshold, and bull: cow ratios are bordering the threshold. Lots of variability in hunting efforts data and the N/A are skewing the male ratio efforts. It would appear both the hunting efforts and male hunted ratios have increased since the regulation changes.

| Worth mentioning that this MU increased by 14% from 2012 to 2018, yet it receives the 2nd highest hunting pressure of all MUs in the region. | North Peace | 7-32 | N/A | 7-32 | 3683444207 | 3683.444207 | 2017/2018 | W | SRB | 3684 | Yes | 0.82 | 14.10% | 0.41 | 0.44 | 1.16 | 0.94 | 23 | 3462.437554 |
| Why are we extrapolating here? 7-32 is quite different from 7-33, but more importantly, we just had a survey completed in this MU and reported our highest regional moose density of 1.18 moose/km2. Why was this not included? This population increased by 24% from 2006 to 2019, yet it receives the highest hunting pressure of all MUs in the Peace region. | North Peace | 7-33 | 7-32 | 7-33 | 5780512751 | 5780.512751 | 2017/2018 | W | SRB | 3684 | Yes | 0.82 | 14.10% | 0.41 | 0.44 | 1.16 | 0.94 | 23 | 5433.681985 |
| This MU certainly appeared to be in a declining trend. | North Peace | 7-34 | N/A | 7-34 | 1509268133 | 1509.268133 | 2015/2016 | W | SRB | 1467 | Yes | 0.60 | 15.23% | 0.22 | 0.34 | 1.23 | 0.74 | 18 | 1116.858418 |
| With a SCF applied, this MU would have a density of > 1 moose/km2 | North Peace | 7-35 | N/A | 7-35 | 2375507652 | 2375.507652 | 2013/2014 | W | SRB | 2376 | Yes | 0.835 | 15.77% | 0.376 | 0.301 | N/AV | N/AV | 25 | 1983.548889 |

| Why don't we include harvest and harvest rates here? We have all of that information tabulated already. It tells a much more full story. | | | | | | | | | | | | | | | | | | | |
| Based on the best available data, the overall harvest rates (avg. from 2012-2019) by GMZ are as follows: South Peace 3.2%, North Peace 3.0%, Northeast Rockies 3.7%, Fort Nelson 2.4%, and Liard 2.4%. These harvest rates are calculated after applying a 5% FNs harvest rate to the population estimates. | | | | | | | | | | | | | | | | | | | |
| One takeaway is that the three MUs that are subjected to the highest harvest pressure have all shown population increases in the past 5-20 years, ranging from 14% - 53% increase. | | | | | | | | | | | | | | | | | | | |

Hey guys,
bit of a hot topic it is not only controversial with stakeholders but also very much not supported by the bios internally. I think you were cc'ed on the reviews of this reg-change proposal. I added them back into this email so they are all in one spot.
I am wondering if a meeting with bios and Michel would be beneficial?

Holger

Hi Michel,
We can support from both the ungulate specialist position (Holger) and regs lead (Steve).

Thanks,
Michael

Subject: Resource request - R7B Moose Regulation

Good afternoon Michael,

I attached an early draft of one of our Region's proposed regulation changes. We are expecting this will generate a lot of comment from stakeholders (BCWF and guide-outfitters) and the public through regional discussion and AHTE. Do you have someone available to support engagement for this proposal?

Hello everyone,

I just wanted to follow up with a few caveats to these data.

Moose densities/ratios are uncorrected because there is a lack of data with corrected values. The confident intervals and error bars are therefore also uncorrected. The figures themselves are a working document and are not a finished product. So I apologize for the sloppiness of them.

The regression analyses are on the hunting efforts only. I don't think this is clear from the document. The lm formula for these data could be examined closer, and there are more robust functions I feel could have been utilized in this analysis. Both hunting efforts and resident male ratios are on raw data!

Population estimates have a lot of 'extrapolated' data where the adjacent MU estimates were used. Nothing before 2015 was used however, this led to 30 to 40% of the MUs having extrapolated estimates.

I feel there's a lot of improvements to be made on these analyses so please let us know of any comments or if this information will be shared further and I will make the appropriate improvements!

Thank you
Dominica

Subject: Request for review - R7B Moose regulation change proposal

Good afternoon,

The Northeast Region has been working through the moose data available. Dominica has used known moose densities within the different MUs and Game Management Zones to estimate moose populations where we don't have inventories or the data is too old to be reliable (excel sheet). She completed non-linear regression analysis, population, and hunting effort summaries for each GMZ.

We reviewed some recent food security research for First Nation communities along the Peace River to estimate potential First Nation moose subsistence needs in the region, Hunter Survey harvest estimates, and different ways of calculating the AAH.

We are expecting this will receive a lot of public feedback and we would like to be fairly confident we are heading in the right direction and have considered our options before starting engagement in the Northeast.

Can you review the calculations/analysis and draft regulation proposal? Feel free to contact Dominica or me if you have questions, comments, or suggested edits.

Please don't distribute these documents further.

Michel Lavallée, M.SEM., R.P.Bio.

Hey gents,

I had a quick look at the moose LEH proposal package that was sent out for review. The management team here was not willing to send it to me for some reason (as you saw in those emails, Burwash), but I was able to get my hands on some copies. I'm not sure what their concern was with sharing this information with me specifically, as it's all just based off of our regional moose data.

Anyhow, overall I did find the documents to be quite misleading. So I added quite a few comments that I think help tell the full story of the moose situation in our region here. [s.13](#)

[s.13](#)

I added quite a few comments to the two word documents, and to the one spreadsheet. I also included our regional moose harvest tracking spreadsheet, which I believe helps tell a more fulsome story.

Let me know if you'd like to discuss at some point.

Cheers,

Mike

3. Map associated with the proposed regulation. ☐ Yes ☒ No

- This map may be used to form the regulation. It should be digital and professional. Please provide shapefiles if available.

4. Reason for proposal (rationale in plain language): IMPORTANT – this is what goes on the public engagement website (AHTE) verbatim

Moose populations are stable to declining across most of the Northeast Region. Stakeholders and First Nations are concerned about the populations ability to support First Nation sustenance harvest, licenced harvest, and non-consumptive values due to the pressures of landscape changes and hunting practices. A series of regulation changes were implemented to reduce licenced moose harvest during the last 6 years; moose populations do not appear to be stabilizing with these changes. Addressing habitat concerns is a long process and industry specific; moving moose from General Open Season to Limited Entry Hunt is intended to maintain moose harvest opportunity while providing more oversight of the number of moose harvested within the Region. Changing part of the Northeast Region to LEH while keeping other areas GOS risks moving hunters into areas with lower hunting pressure and increasing moose harvest in currently stable populations. The Youth LEH season is intended to provide opportunity for youth to harvest moose before returning to school and having reduced opportunity during the remaining seasons. The two LEH opportunities (September 1 – September 30 and October 16 – October 31) are intended to balance harvest pressure before and after the rut to support reproductive success; the number of authorizations can be adjusted to maintain post-hunt bull to cow ratios. All three LEH opportunities are Any Bull to distribute harvest pressure across the different age classes and offset loss of harvest opportunity by increasing the number of moose that could be legally harvested.

s.13

PART B: ANALYSIS

1. Describe surveys used for conservation issues and their results as they relate to this submission:

Moose inventory data in the Northeast Region does not have the required frequency or coverage to estimate population trends for most of the management units. The recent inventories (2015-2021), demographics, and densities were calculated for each management unit and extrapolated into management units that do not have current inventory data using available information within each Game Management Zone. The result of this work indicates the Northeast Region has 60,660 moose (minimum 47,705 and a maximum of 73,615 moose); the Northeast Region contains an estimated 16,307 (12,406 – 20,208) bulls, 33,257 (26,375 – 40,140) cows, and 11,094 (8,923 – 13,266) calves).

Work completed by Kuzyk and colleagues in 2018¹ modelled moose population trends across the Province and found each Northeast Game Management Zone has a decreasing population trend ($\lambda < 1$) between 2006 and 2015; a change from the 1996-2005 period where only one Game Management Zone had a declining population trend. This perspective is supported by all the Northeast Region's First Nations who have indicated moose populations are decreasing and harvesting is becoming challenging. Declining hunter effort in the Big Game Harvest Survey is likely a hunter response to declining moose populations and declining success rates.

Research completed by Natcher and colleagues² in 2021 indicates First Nation communities harvest annually 2.1 – 2.4 moose per household. There is a minimum of 677 First Nation residences in the Northeast Region and an unknown number of households from transboundary First Nations (Kaska Daylu Council, Dene Tha' First Nation, Horselake First Nation, McLeod Lake Indian Band) that may hunt in the Region. Approximately 1,421 to 1,624 moose are harvested by First Nations assuming every household is actively harvesting moose and the estimate for households that don't harvest is balanced by harvest from First Nations bordering the Region. First Nations prefer to harvest bull moose to protect the cows and support a sustainable population; exceptions are made for dry cows since they did not successfully reproduce and would be harvested for sustenance purposes. The First Nation harvest distribution can be adjusted to 75% of the moose harvested are bull (1,066 – 1,218) and 25% of the harvest is are dry cows (355 – 406).

Licensed hunters harvested an estimated 1,489 moose in 2019. The combined licensed and First Nation subsistence harvest may be 2,910 – 3,113 moose annually (2,555 – 2,707 bull moose assuming First Nation bull harvest is 75% of the total First Nation harvest).

The Harvest Management Principles described in the Provincial Moose Management Framework suggest the maximum moose population growth of 15% occurs when wolf populations are controlled. A minimum of 32 calves per 100 cows is required to compensate for natural mortality. The maximum harvest rate suggested is 10-11% of the population when harvest is distributed across bulls, cows, and calves. First Nation subsistence practices favors harvesting bull moose and licensed harvest is restricted to bulls with further restrictions based on antler configuration. Even distribution across the population does not occur under the current cultural practices and regulatory requirements which requires a lower maximum allowable harvest rate to account for the selective harvest practices; a recommendation is 5% of the population (3,033 \pm 348). The annual estimated combined harvest of licensed hunters and First Nations is approximately 4.9% (ranges from 4.1% to 6.3%) of the total population. This harvest rate requires higher calf recruitment of 30-45 calves per 100 cows to maintain stable populations.

Calf recruitment in the Northeast Region ranges from 7 calves per 100 cows (MU 7-57 in 2017) to 68 calves per 100 cows (MU 7-47 in 2016) with a regional average of 32 calves per 100 cows. The regional moose recruitment has remained in this range during the last 20 years. This recruitment level indicates regional moose populations are likely to continue declining under current the wildlife management practice. Changing to LEH may provide the Province the flexibility required to maintain the bull composition and slow the population declines while long-term measures are implemented to change the main population drivers.

Kuzyk and colleagues¹ publication indicates a maximum bull harvest of 20% would be sustainable for most moose populations in the Province. Based on the current population estimates, the Northeast Region could support the harvest of 3,261 (\pm 780) bull moose annually which is approximately equal to current harvest rates.

Local overharvesting is challenging to avoid through General Open Season since hunters have the flexibility to harvest moose based on hunter preference and access. Antler restrictions have not stabilized the moose populations; moving to Limited Entry Hunt provides the Province the ability to distribute harvest pressure across the Region to reduce the risk of overharvesting in certain areas. The proposed Any Bull LEH is intended to support hunters' opportunity to successfully harvest moose while addressing potential enforcement challenges and unlawful harvest encountered when hunters do not accurately count points on the antler.

s.13

The Any Bull LEH would distribute harvest pressure across more age classes rather than the current focused harvest on young bulls (spike-fork) or older bulls (tri-palm, 10 point).

Management Units 7-21B, 7-22, and 7-31B overlap the South Peace Caribou recovery efforts and wolf control zones. Keeping these Management Units as GOS will encourage moose harvest within the caribou recovery areas and slow moose population growth.

The Moose LEH Shared hunt allows family or friends to continue moose hunting together without increasing the number of authorizations issued to support the continuation of this practice and knowledge transfer to newer hunters.

¹ Kuzyk, G., I. Hatter, S. Marshall, C. Procter, B. Cadsand, D. Lirette, H. Schindler, M. Bridger, P. Stent, A. Walker, and M. Klaczek. 2018. Moose population dynamics during 20 years of declining harvest in British Columbia. *Alces* 54:101-119

² Natcher, D., S. Ingram, A-M. Bogdan, and A. Rice. 2021. Conservation and Indigenous subsistence hunting in the Peace River Region of Canada. *Human Ecology*. 49:109-120

2. Alternatives to regulation considered:

The Northeast Region has implemented more restrictive hunting regulations to address declining moose populations, but these have not generated the expected change.

Alternatives considered:

- Current regulation structure – moose populations have been declining for over 20 years. The current regulations have been inadequate to stabilize the populations.
- The calf recruitment is low across the Region and is inadequate to stabilize the population. The main driver behind low calf recruitment and survival is predation. Increasing the wolf bag limit to 10 has been proposed and not supported since licenced hunters currently can harvest 3 wolves annually and few hunters consistently harvest wolves. Increasing the limit is unlikely to have a direct, consistent, and sustainable benefit for moose.
- Implementing a predator control program in specific Game Management Zones to enhance calf moose survival. The Management Plan for Grey Wolf (*Canis lupus*) in British Columbia is clear (section 7.4) that implementing predator control to enhance ungulate populations for hunting is contrary to policy. Licenced hunting opportunities will need to be closed before this alternative can be considered.

3. Pros/Cons analysis undertaken & results:

Pros:

- Low calf recruitment indicates moose declines are likely to continue, LEH provides the ability to collect hunter success data and adjust LEH authorizations and quota before the maximum harvest declines below current harvest levels.
- First Nations requested the Province management moose under LEH; this is responsive to their requests
- Responds to First Nations' local and traditional knowledge regarding moose populations
- The Province will need to explicitly consider First Nation Treaty 8 right to hunt when making quota and LEH decisions
- The Province would be able to distribute harvest across the region and reduce the risk of localized overharvesting
- Regional staff and Branch have more control over moose harvest and can adjust LEH authorizations to support management objectives
- Precautionary approach for management units without current inventory data to reduce risk of moose becoming a species of conservation concern

Cons:

- LEH is unlikely to stabilize or increase the moose populations without addressing habitat and predation
- Licenced hunting community harvests moose for food. A moose provides approximately 200kg of meat for the cost of a hunting licence (\$32) and species licence (\$25). There are additional, variable costs associated with hunting – fuel, travel, accommodations, cut & wrap – that are harder to incorporate since this varies between hunters. Replacing 220kg of moose meat with 220kg of beef would cost approximately \$3,370³ using beef's 2020 weighted average of \$15.31/kg.
- Licenced hunters may be upset on the reduced opportunity.
- Northeast licenced hunters will have reduced opportunity under the current LEH system
- Updating the licencing system to include the new LEH codes will take time and resources
- Additional staff time to calculate annual LEH and quota recommendations
- First Nations may expect this change will stop or reverse moose population declines
- Decreased number of hunters traveling from other Regions to the Northeast for moose hunting
- Increased harvest pressure in the other Regions that have moose general open season

s.13

³ Agriculture and Agri-Food Canada. Red Meat and Livestock Market Information – Prices. <https://www.agr.gc.ca/eng/canadas-agriculture-sectors/animal-industry/red-meat-and-livestock-market-information/prices/annual-retail-beef-and-historical-pork-prices/?id=1520539054104>

4. Identify risks of NOT implementing the new provision:

The risks associated with not implementing the regulation change could be the non-recoverable collapse of the moose population within the Peace Region. If the general open season continues to operate, the moose population may decrease past a recoverable population. Alternatively, it could lead to a recoverable population, that would require either a LEH or a closed season to allow the population to recuperate. This would also frustrate hunters and stakeholders.

If the government does not listen to the Traditional Knowledge of the local First Nations, there may be a potential violation of Treaty 8 rights, as the population of moose continues to decrease, and sustenance harvest is affected, a lawsuit may be initiated.

5. Comments by Reviewers: (if relevant)

Use separate page, as comments may not be included in the final OIC/MO Package.
Copies of email correspondence may be attached.

PART D: STAKEHOLDER CONSULTATION

ADEQUATE CONSULTATION AND ENGAGEMENT MUST BE RECORDED, OR THE FORM WILL BE RETURNED TO THE ORIGINATOR.

Please attach supporting documentation, such as letters, meeting minutes, etc.

Identify who was consulted and when consultations took place.

Who raised concerns and what was the nature of their concerns?

Has the regulation been changed to respond to Stakeholders' Concerns?

PART E: INDIGENOUS CONSULTATION AND ENGAGEMENT

Please attach supporting documentation, such as letters, meeting minutes, etc.

When did initial consultation and engagement period begin? _____

| | |
|--|--|
| a) Does this proposed change have implications (impact or of interest to) Indigenous Peoples? | <input type="checkbox"/> NO - If no, please explain _____ <input type="checkbox"/> YES - If yes, please complete items (b) to (e) if applicable _____ |
| b) Does this proposed change relate to the Calls to Action of the Truth and Reconciliation Commission? | <input type="checkbox"/> NO <input type="checkbox"/> YES - If yes, please indicate which of the calls and how _____ |

| | |
|---|--|
| <p>c) Does this proposed change relate to any of the following legal or other government obligations?</p> <ul style="list-style-type: none"> • modern treaty obligations to notify, discuss or consult, • common law consultation obligations, • contractual commitments, • under the <i>Declaration on the Rights of Indigenous Peoples Act</i>? | <p><input type="checkbox"/> NO</p> <p><input type="checkbox"/> YES – If yes, please explain how</p> <hr/> <p>Please review the following to help you with your analysis: ILR Reference Document: Indigenous Legal Relations Review of Cabinet Submissions*; UN Declaration Reference Document*; Provincial Legislation Engagement with Treaty Nations Guide</p> <p>*Note: You may have to request permission to the site from the Ministry of Attorney General.</p> |
| <p>d) Does this proposed change affect Indigenous peoples' modern or historic treaty rights or Aboriginal rights, including any Aboriginal title?</p> | <p><input type="checkbox"/> NO</p> <p><input type="checkbox"/> YES – If yes, please indicate how.</p> <p>Was the consultation sufficient for the purposes of the constitutional obligations?</p> <hr/> |
| <p>e) Have Indigenous peoples, including Indigenous organizations, been involved in the development of the proposed change, and will they be involved in its implementation?</p> | <p><input type="checkbox"/> NO - If no, please explain why not</p> <hr/> <p><input type="checkbox"/> YES - If yes, what views were expressed or how will they be sought?</p> <hr/> <p>Please review the Policy Framework for Advancing Reconciliation with Indigenous Peoples for guidance on involving Indigenous peoples in your policy development.</p> <p>If you would like further support with this section, please contact Legislative Alignment and Process.</p> |

Indigenous Peoples

We require the name of each Indigenous group engaged and individuals within the group. When did the engagement and consultation take place and in what forum (letter, fax, meeting, etc.)? What was the response or outcome of engagement (band by band or tribal association)? What might be the anticipated impact of this proposal on the Indigenous peoples ability to practice their Aboriginal Interests?

If consultation/engagement with Indigenous peoples is incomplete/ongoing indicate the anticipated completion date.

Standard thresholds used:

Densities: 200/1000 moose per km² above is high density below is low density marked by a black horizontal line on the uncorrected densities figures.

Sex Ratios: Bull: cow thresholds High density 50/1000 bull: cow and 30/1000 bull: cow indicated by a blue line on ratio figures; raw data indicated by blue circles. Calf: cow thresholds: high density: 30/1000 calf: cow and low density 25/1000 calf cow indicated by a red line on ratio figures; Raw data indicated by red triangles.

For both hunting efforts and hunted male black vertical lines indicate 1996 and 2006 implementation of SOFT and SOFT 10 respectively hunting regulation changes.

South Peace: Densities are near or below the low population threshold. Bull: cow ratios mostly above threshold hold for high densities population standard. Compared to Calf: cow ratios near or below the threshold limit for high population densities. Hunting efforts have been increasing since 2006 regulations changes, and male hunting pressure also increased substantially. With high hunting efforts and high male pressure, the change in regulations seems to affect hunting efforts, putting pressure on bulls. However, the bull: cow ratios remain just above the threshold for high population densities.

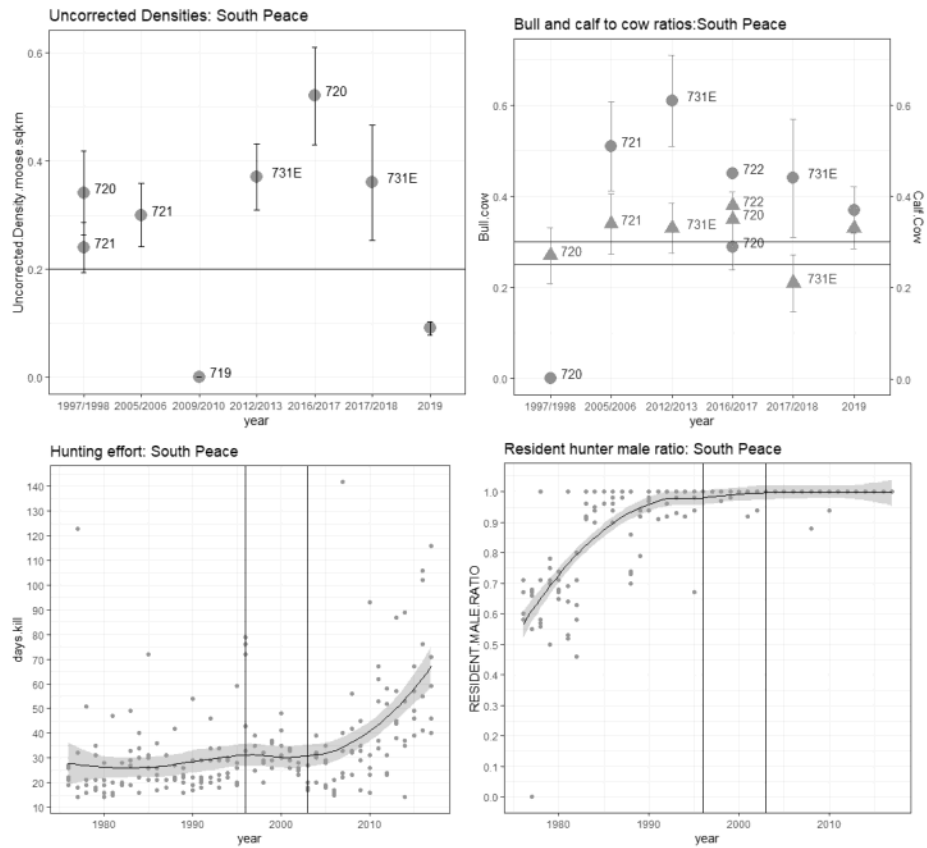

North Peace: High densities population with lots of data (though relatively high error estimates). Calf: cow remains above the high-density threshold, and bull: cow seems to border the threshold for high densities. Some MU's are only slightly above, and some are just under in recent survey reports. Hunting efforts have increased a lot since 2006 regulation changes and quite a few high outliers (above 70 days) since 2010. Male ratios since 2006 increased then remain high; however, not as stark as other regions. The male pressure seems to be slightly more favorable.

Northeast Rockies: Population densities seem to be declining dramatically since the early 2000s. However, this could be due to survey efforts and methodologies. I.e., the more recent surveys are more representative as there is lots of variability in the surveys from the 90s (also strictly from MU 7-42). The 2000s surveys seem to have low error estimates. The densities border around the threshold, so this region was labeled as low density. Calf: cow ratios are well below the threshold and should be a reason to investigate further. Bull: cow border the threshold in recent years depending on MU surveyed. Hunting efforts and male ratios are increasing since the 1996/2006 regulation changes, suggesting pressure on the bull populations.

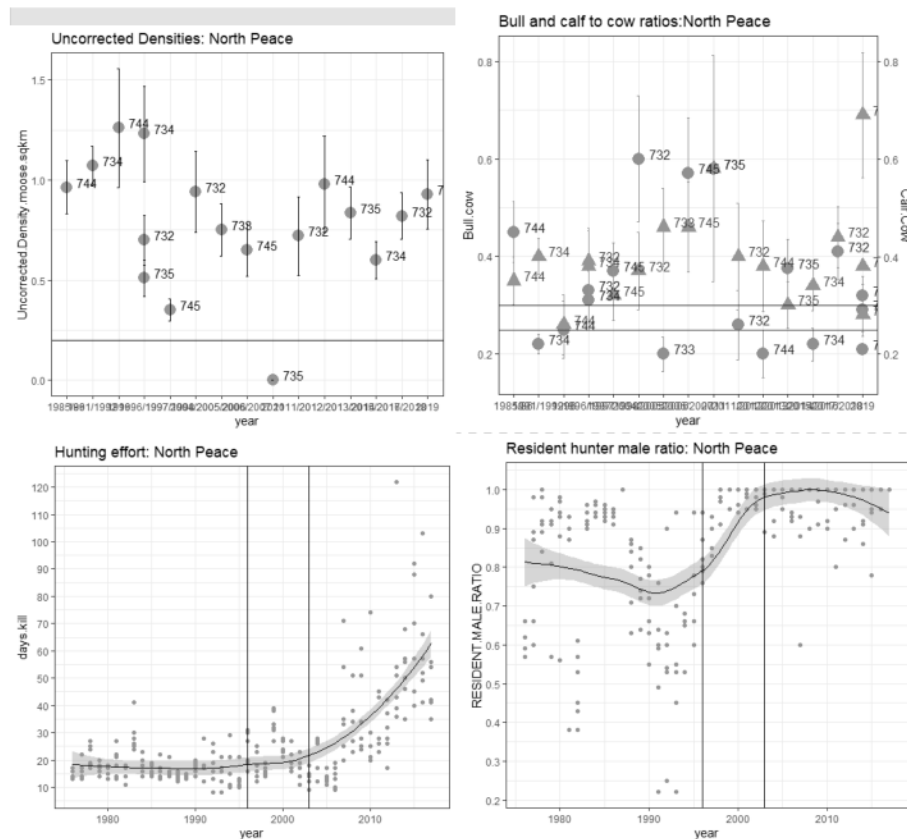

Liard: Density data is sparse, and surveys have high variability. Population estimates are not specific. Bull: cow ratios are above the Calf: cow ratios and above the thresholds. Calf: cow ratios are all on the threshold. However, the data is not ideal. Hunting efforts have lots of variabilities. They seem to be increasing since the 1996/2006 regulation changes but not as dramatically as other regions. Male ratios are high. A few outlier n/a data is skewing the more recent results in the male hunting ratios.

Fort Nelson: Low density populations. Calf: cow ratios are below the threshold, and bull: cow ratios are bordering the threshold. Lots of variability in hunting efforts data and the N/A are skewing the male ratio efforts. It would appear both the hunting efforts and male hunted ratios have increased since the regulation changes.

| Bridger Comments | GMZ | MU | Extrapolated MU | WILDLIFE_MG MT_UNIT_ID | MU Area Square Meters | MU area Km squared | Survey Period | Season | Survey Type | Survey Area (km2) | Whole MU (Y/N) | Uncorrected Density (moose/sq.km.) | 90%CI (±%) | Bull/Cow | Calf/Cow | SCF | Corrected Density (moose/sq.km.) | Degrees of Freedom | Total estimated pop |
|--|-------------------|-----------|-----------------|------------------------|-----------------------|--------------------|---------------|--------|-------------|-------------------|----------------|------------------------------------|------------|----------|----------|------|----------------------------------|--------------------|---------------------|
| 7-20 is not comparable for extrapolation to 7-19. The habitat differs greatly through much of 7-20 (Ag. zone and deciduous) | South Peace | 7-19 | 7-20 | 7-19 | 4376928492 | 4376.928492 | 2016/2017 | W | SRB | 4356 | Yes | 0.52 | 17.30% | 0.29 | 0.35 | 1.2 | 0.61 | 20 | 2669.92638 |
| We should be showing trends here. This MU increased by 53% since it's last survey. Yet it has the highest hunting pressure of all South Peace MUs. | South Peace | 7-20 | N/A | 7-20 | 4366346867 | 4366.346867 | 2016/2017 | W | SRB | 4356 | Yes | 0.52 | 17.30% | 0.29 | 0.35 | 1.2 | 0.61 | 20 | 2663.471589 |
| This is a caribou recovery area. Should be targeting a density <0.3 moose/km2 | South Peace | 7-21 | 7-20 | 7-21 | 6731326271 | 6731.326271 | 2016/2017 | W | SRB | 4356 | Yes | 0.52 | 17.30% | 0.29 | 0.35 | 1.2 | 0.61 | 20 | 4106.109025 |
| This is a caribou recovery area. Should be targeting a density <0.3 moose/km2 | South Peace | 7-22 | 7-31 | 7-22 | 4159522683 | 4159.522683 | 2016/2017 | W | Comp | N/R | No | 0.36 | 29.60% | 0.45 | 0.38 | N/A | N/A | N/A | 1497.428166 |
| This is a caribou recovery area. Should be targeting a density <0.3 moose/km2 | South Peace | 7-31E | N/A | 7-31 | 5397753013 | 5397.753013 | 2017/2018 | W | SRB | 2431 | No | 0.36 | 29.60% | 0.44 | 0.21 | 1.18 | 0.44 | | 2375.011326 |
| Worth mentioning that this MU increased by 14% from 2012 to 2018, yet it receives the 2nd highest hunting pressure of all MUs in the region. | North Peace | 7-32 | N/A | 7-32 | 3683444207 | 3683.444207 | 2017/2018 | W | SRB | 3684 | Yes | 0.82 | 14.10% | 0.41 | 0.44 | 1.16 | 0.94 | 23 | 3462.437554 |
| Why are we extrapolating here? 7-32 is quite different from 7-33, but more importantly, we just had a survey completed in this MU and reported our highest regional moose density of 1.18 moose/km2. Why was this not included? This population increased by 24% from 2006 to 2019, yet it receives the highest hunting pressure of all MUs in the Peace region. | North Peace | 7-33 | 7-32 | 7-33 | 5780512751 | 5780.512751 | 2017/2018 | W | SRB | 3684 | Yes | 0.82 | 14.10% | 0.41 | 0.44 | 1.16 | 0.94 | 23 | 5433.681985 |
| This MU certainly appeared to be in a declining trend. | North Peace | 7-34 | N/A | 7-34 | 1509268133 | 1509.268133 | 2015/2016 | W | SRB | 1467 | Yes | 0.60 | 15.23% | 0.22 | 0.34 | 1.23 | 0.74 | 18 | 1116.858418 |
| With a SCF applied, this MU would have a density of > 1 moose/km2 | North Peace | 7-35 | N/A | 7-35 | 2375507652 | 2375.507652 | 2013/2014 | W | SRB | 2376 | Yes | 0.835 | 15.77% | 0.376 | 0.301 | N/AV | N/AV | 25 | 1983.548889 |
| | North Peace | 7-44 | N/A | 7-44 | 2369068573 | 2369.068573 | 2012/2013 | W | SRB | 2368 | Yes | 0.98 | 24.50% | 0.2 | 0.38 | 1.35 | 1.32 | 20 | 3127.170516 |
| | North Peace | 7-45 | 7-34 | 7-45 | 6213899316 | 6213.899316 | 2015/2016 | W | SRB | 1467 | Yes | 0.60 | 15.23% | 0.22 | 0.34 | 1.23 | 0.74 | 18 | 4598.285493 |
| Extrapolation here is likely leading to an overestimate. Much of this MU is not good moose habitat. This MU is subject to wolf reduction now. | Northeast Rockies | 7-36 | 7-43 | 7-36 | 3389485533 | 3389.485533 | 2019/20 | W | SRB | 2430 | Yes | 0.27 | 19.90% | 0.58 | 0.39 | 1.54 | 0.42 | | 1423.583924 |
| This MU was certainly on a declining trend. But appeared to be an issue with calf recruitment. Not harvest pressure. This is also a caribou recovery area under wolf reduction now. | Northeast Rockies | 7-42 | N/A | 7-42 | 6065820764 | 6065.820764 | 2014/15 | W | SRB | 5905 | Yes | | 12.92% | 0.45 | 0.12 | 1.20 | 0.24 | 53 | 1455.796983 |
| Caribou recovery area, subject to wolf reduction. | Northeast Rockies | 7-43 | N/A | 7-43 | 3033443375 | 3033.443375 | 2019/20 | W | SRB | 2430 | Yes | 0.27 | 19.90% | 0.58 | 0.39 | 1.54 | 0.42 | | 1274.046217 |

| | | | | | | | | | | | | | | | | | | | 60660.13923 |
| Why don't we include harvest and harvest rates here? We have all of that information tabulated already. It tells a much more fullsize story. | | | | | | | | | | | | | | | | | | | |
| Based on the best available data, the overall harvest rates (avg. from 2012-2019) by GMZ are as follows: South Peace 3.2%, North Peace 3.0%, Northeast Rockies 3.7%, Fort Nelson 2.4%, and Liard 2.4%. These harvest rates are calculated after applying a 5% FNs harvest rate to the population estimates. | | | | | | | | | | | | | | | | | | | |
| One takeaway is that the three MUs that are subjected to the highest harvest pressure have all shown population increases in the past 5-20 years, ranging from 14% - 53% increase. | | | | | | | | | | | | | | | | | | | |

Subject: RE: Request for review - R7B Moose regulation change proposal

Hi there,

Thanks Michel for the opportunity to comment. There are many variables to consider if a region is contemplating a regulation change of this magnitude, and I do appreciate having the chance to weigh in.

I am quite time limited this week to provide a more fulsome response, but I will provide additional comments early next week.

s.13

Thanks for putting this info package together for us to review, and again. for the chance to comment.

Heidi

Thanks for the opportunity to comment Michel. I had a look through the proposal and attached data and have some comments. Sorry if it's long winded, I provide all my comments here and not on the documents themselves. I mean no disrespect to whoever wrote the proposal with any of my comments below.

s.13

Let me know if there are any questions about any of the above and thanks again for the opportunity to comment on this proposal.

Subject: Request for review - R7B Moose regulation change proposal

Good afternoon,

The Northeast Region has been working through the moose data available. Dominica has used known moose densities within the different MUs and Game Management Zones to estimate moose populations where we don't have inventories or the data is too old to be reliable (excel sheet). She completed non-linear regression analysis, population, and hunting effort summaries for each GMZ.

We reviewed some recent food security research for First Nation communities along the Peace River to estimate potential First Nation moose subsistence needs in the region, Hunter Survey harvest estimates, and different ways of calculating the AAH.

We are expecting this will receive a lot of public feedback and we would like to be fairly confident we are heading in the right direction and have considered our options before starting engagement in the Northeast.

Can you review the calculations/analysis and draft regulation proposal? Feel free to contact Dominica or me if you have questions, comments, or suggested edits.

Please don't distribute these documents further.

Subject: Resource request - R7B Moose Regulation
Attachments: R7B_2022-Moose from GOS to LEH.docx

Good afternoon Michael,

I attached an early draft of one of our Region's proposed regulation changes. We are expecting this will generate a lot of comment from stakeholders (BCWF and guide-outfitters) and the public through regional discussion and AHTE. Do you have someone available to support engagement for this proposal?

PART A: BACKGROUND

1. What is currently in the synopsis? (exact wording preferred)

| | | | |
|----------|--|--------|------------------|
| Moose | 7-21B, 7-22, 7-31B | Bulls | Aug 15 – Aug 31 |
| | 7-19, 7-20, 7-21A, 7-31A, 7-32, 7-33, 7-35, 7-36, 7-42, 7-43, 7-46 to 7-56 ▲ | Bulls | Aug 23 – Aug 31 |
| | 7-19, 7-21B, 7-22, 7-31, 7-36, 7-42, 7-43, 7-46 to 7-56+▲ | *Bulls | Sept 1 – Oct 31 |
| | 7-20, 7-21A, 7-32 to 7-35, 7-44, 7-45, 7-57, 7-58 | *Bulls | Sept 1 – Sept 30 |
| | 7-20, 7-21A, 7-32 to 7-35, 7-44, 7-45, 7-57, 7-58 | *Bulls | Oct 16 – Oct 31 |
| Bow Only | 7-20, 7-21A, 7-32 to 7-35, 7-44, 7-45, 7-57, 7-58 | *Bulls | Oct 1 – Oct 15 |

2. Briefly describe the proposed wording in the synopsis:

GOS

| | | | |
|----------|---|--------|-----------------|
| Moose | 7-21B, 7-22, 7-31B | Bulls | Aug 15 – Aug 31 |
| | 7-21B, 7-22, 7-31B | *Bulls | Sept 1 – Oct 31 |
| Bow Only | 7-20, 7-21A, 7-32 to 7-35, 7-44, 7-45, 7-57, 7-58 | *Bulls | Oct 1 – Oct 15 |

LEH

| | | | |
|--------------------|--|-------|------------------|
| Moose; youth only | 7-19, 7-20, 7-21A, 7-31A, 7-32, 7-33, 7-34, 7-35, 7-36, 7-42, 7-43, 7-46 to 7-56▲ | Bulls | Aug 23 – Aug 31 |
| Moose; shared hunt | 7-19, 7-20, 7-21A, 7-31A, 7-32, 7-33, 7-34, 7-35, 7-36, 7-42, 7-43, 7-46 to 7-56▲ | Bulls | Sept 1 – Sept 30 |
| | 7-19, 7-20, 7-21A, 7-31A, 7-32, 7-33, 7-34, 7-35, 7-36, 7-42, 7-43, 7-46 to 7-56+▲ | Bulls | Oct 16 – Oct 31 |

3. Map associated with the proposed regulation. ☐ Yes ☒ No

- This map may be used to form the regulation. It should be digital and professional. Please provide shapefiles if available.

4. Reason for proposal (rationale in plain language): IMPORTANT – this is what goes on the public engagement website (AHTE) verbatim

Moose populations are stable to declining across most of the Northeast Region. Stakeholders and First Nations are concerned about the populations ability to support First Nation sustenance harvest, licenced harvest, and non-consumptive values due to the pressures of landscape changes and hunting practices. A series of regulation changes were implemented to reduce licenced moose harvest during the last 6 years; moose populations do not appear to be stabilizing with these changes. Addressing habitat concerns is a long process and industry specific; moving moose from General Open Season to Limited Entry Hunt is intended to maintain moose harvest opportunity while providing more oversight of the number of moose harvested within the Region. Changing part of the Northeast Region to LEH while keeping other areas GOS risks moving hunters into areas with lower hunting pressure and increasing moose harvest in currently stable populations. The Youth LEH season is intended to provide opportunity for youth to harvest moose before returning to school and having reduced opportunity during the remaining seasons. The two LEH opportunities (September 1 – September 30 and October 16 – October 31) are intended to balance harvest pressure before and after the rut to support reproductive success; the number of authorizations can be adjusted to maintain post-hunt bull to cow ratios. All three LEH opportunities are Any Bull to distribute harvest pressure across the different age classes and offset loss of harvest opportunity by increasing the number of moose that could be legally harvested.

PART B: ANALYSIS

1. Describe surveys used for conservation issues and their results as they relate to this submission:

Moose inventory data in the Northeast Region does not have the required frequency or coverage to estimate population trends for most of the management units. The recent inventories (2015-2021), demographics, and densities were calculated for each management unit and extrapolated into management units that do not have current inventory data using available information within each Game Management Zone. The result of this work indicates the Northeast Region has 60,660 moose (minimum 47,705 and a maximum of 73,615 moose); the Northeast Region contains an estimated 16,307 (12,406 – 20,208) bulls, 33,257 (26,375 – 40,140) cows, and 11,094 (8,923 – 13,266) calves).

Work completed by Kuzyk and colleagues in 2018¹ modelled moose population trends across the Province and found each Northeast Game Management Zone has a decreasing population trend ($\lambda < 1$) between 2006 and 2015; a change from the 1996-2005 period where only one Game Management Zone had a declining population trend. This perspective is supported by all the Northeast Region's First Nations who have indicated moose populations are decreasing and harvesting is becoming challenging. Declining hunter effort in the Big Game Harvest Survey is likely a hunter response to declining moose populations and declining success rates.

Research completed by Natcher and colleagues² in 2021 indicates First Nation communities harvest annually 2.1 – 2.4 moose per household. There is a minimum of 677 First Nation residences in the Northeast Region and an unknown number of households from transboundary First Nations (Kaska Daylu Council, Dene Tha' First Nation, Horselake First Nation, McLeod Lake Indian Band) that may hunt in the Region. Approximately 1,421 to 1,624 moose are harvested by First Nations assuming every household is actively harvesting moose and the estimate for households that don't harvest is balanced by harvest from First Nations bordering the Region. First Nations prefer to harvest bull moose to protect the cows and support a sustainable population; exceptions are made for dry cows since they did not successfully reproduce and would be harvested for sustenance purposes. The First Nation harvest distribution can be adjusted to 75% of the moose harvested are bull (1,066 – 1,218) and 25% of the harvest is are dry cows (355 – 406).

Licensed hunters harvested an estimated 1,489 moose in 2019. The combined licensed and First Nation subsistence harvest may be 2,910 – 3,113 moose annually (2,555 – 2,707 bull moose assuming First Nation bull harvest is 75% of the total First Nation harvest).

The Harvest Management Principles described in the Provincial Moose Management Framework suggest the maximum moose population growth of 15% occurs when wolf populations are controlled. A minimum of 32 calves per 100 cows is required to compensate for natural mortality. The maximum harvest rate suggested is 10-11% of the population when harvest is distributed across bulls, cows, and calves. First Nation subsistence practices favors harvesting bull moose and licensed harvest is restricted to bulls with further restrictions based on antler configuration. Even distribution across the population does not occur under the current cultural practices and regulatory requirements which requires a lower maximum allowable harvest rate to account for the selective harvest practices; a recommendation is 5% of the population (3,033 ± 348). The annual estimated combined harvest of licensed hunters and First Nations is approximately 4.9% (ranges from 4.1% to 6.3%) of the total population. This harvest rate requires higher calf recruitment of 30-45 calves per 100 cows to maintain stable populations.

Calf recruitment in the Northeast Region ranges from 7 calves per 100 cows (MU 7-57 in 2017) to 68 calves per 100 cows (MU 7-47 in 2016) with a regional average of 32 calves per 100 cows. The regional moose recruitment has remained in this range during the last 20 years. This recruitment level indicates regional moose populations are likely to continue declining under current the wildlife management practice. Changing to LEH may provide the Province the flexibility required to maintain the bull composition and slow the population declines while long-term measures are implemented to change the main population drivers.

Kuzyk and colleagues¹ publication indicates a maximum bull harvest of 20% would be sustainable for most moose populations in the Province. Based on the current population estimates, the Northeast Region could support the harvest of 3,261 (± 780) bull moose annually which is approximately equal to current harvest rates.

Local overharvesting is challenging to avoid through General Open Season since hunters have the flexibility to harvest moose based on hunter preference and access. Antler restrictions have not stabilized the moose populations; moving to Limited Entry Hunt provides the Province the ability to distribute harvest pressure across the Region to reduce the risk of overharvesting in certain areas. The proposed Any Bull LEH is intended to support hunters' opportunity to successfully harvest moose while addressing potential enforcement challenges and unlawful harvest encountered when hunters do not accurately count points on the antler.

The Any Bull LEH would distribute harvest pressure across more age classes rather than the current focused harvest on young bulls (spike-fork) or older bulls (tri-palm, 10 point).

Management Units 7-21B, 7-22, and 7-31B overlap the South Peace Caribou recovery efforts and wolf control zones. Keeping these Management Units as GOS will encourage moose harvest within the caribou recovery areas and slow moose population growth.

The Moose LEH Shared hunt allows family or friends to continue moose hunting together without increasing the number of authorizations issued to support the continuation of this practice and knowledge transfer to newer hunters.

¹ Kuzyk, G., I. Hatter, S. Marshall, C. Procter, B. Cadsand, D. Lirette, H. Schindler, M. Bridger, P. Stent, A. Walker, and M. Klaczek. 2018. Moose population dynamics during 20 years of declining harvest in British Columbia. *Alces* 54:101-119

² Natcher, D., S. Ingram, A-M. Bogdan, and A. Rice. 2021. Conservation and Indigenous subsistence hunting in the Peace River Region of Canada. *Human Ecology*. 49:109-120

2. Alternatives to regulation considered:

The Northeast Region has implemented more restrictive hunting regulations to address declining moose populations, but these have not generated the expected change.

Alternatives considered:

- Current regulation structure – moose populations have been declining for over 20 years. The current regulations have been inadequate to stabilize the populations.
 - The calf recruitment is low across the Region and is inadequate to stabilize the population. The main driver behind low calf recruitment and survival is predation. Increasing the wolf bag limit to 10 has been proposed and not supported since licenced hunters currently can harvest 3 wolves annually and few hunters consistently harvest wolves. Increasing the limit is unlikely to have a direct, consistent, and sustainable benefit for moose.
 - Implementing a predator control program in specific Game Management Zones to enhance calf moose survival. The Management Plan for Grey Wolf (*Canis lupus*) in British Columbia is clear (section 7.4) that implementing predator control to enhance ungulate populations for hunting is contrary to policy. Licenced hunting opportunities will need to be closed before this alternative can be considered.
-

3. Pros/Cons analysis undertaken & results:

Pros:

- Low calf recruitment indicates moose declines are likely to continue, LEH provides the ability to collect hunter success data and adjust LEH authorizations and quota before the maximum harvest declines below current harvest levels.
- First Nations requested the Province management moose under LEH; this is responsive to their requests
- Responds to First Nations' local and traditional knowledge regarding moose populations
- The Province will need to explicitly consider First Nation Treaty 8 right to hunt when making quota and LEH decisions
- The Province would be able to distribute harvest across the region and reduce the risk of localized overharvesting
- Regional staff and Branch have more control over moose harvest and can adjust LEH authorizations to support management objectives
- Precautionary approach for management units without current inventory data to reduce risk of moose becoming a species of conservation concern

Cons:

- LEH is unlikely to stabilize or increase the moose populations without addressing habitat and predation
 - Licenced hunting community harvests moose for food. A moose provides approximately 200kg of meat for the cost of a hunting licence (\$32) and species licence (\$25). There are additional, variable costs associated with hunting – fuel, travel, accommodations, cut & wrap – that are harder to incorporate since this varies between hunters. Replacing 220kg of moose meat with 220kg of beef would cost approximately \$3,370³ using beef's 2020 weighted average of \$15.31/kg.
 - Licenced hunters may be upset on the reduced opportunity.
 - Northeast licenced hunters will have reduced opportunity under the current LEH system
 - Updating the licencing system to include the new LEH codes will take time and resources
 - Additional staff time to calculate annual LEH and quota recommendations
 - First Nations may expect this change will stop or reverse moose population declines
 - Decreased number of hunters traveling from other Regions to the Northeast for moose hunting
 - Increased harvest pressure in the other Regions that have moose general open season
-

4. Identify risks of NOT implementing the new provision:

The risks associated with not implementing the regulation change could be the non-recoverable collapse of the moose population within the Peace Region. If the general open season continues to operate, the moose population may decrease past a recoverable population. Alternatively, it could lead to a recoverable population, that would require either a LEH or a closed season to allow the population to recuperate. This would also frustrate hunters and stakeholders.

If the government does not listen to the Traditional Knowledge of the local First Nations, there may be a potential violation of Treaty 8 rights, as the population of moose continues to decrease, and sustenance harvest is affected, a lawsuit may be initiated.

Sent: April 6, 2021 9:24:38 AM PDT
Attachments: image002.png, image005.png, image004.png
Good Morning All:

I believe I have provided my thoughts to this already but in case there is any confusion on this subject. I am not opposed to regulation changes that are sensitive in nature but as this will become quite political the only way that I will consider an antlerless season regulation change is once full engagement has occurred.

So, what does that mean....

s.16

2. Engagement with the public is also critical, as with First Nation communities, the exchange of current and reliable information is a must. We must fully understand the overall cow/calf moose inventory within the considered management units. We need to have specific targets not just an estimate or percentage of the inventory to be harvested. I want to stress that what we are considering is a culling of moose to protect caribou. So we should ask the question, why allow a regulation to hunt cow/calf when we could complete the cull by government. s.13
s.13

Thus the reason for the engagement.

3. Engagement with stakeholders and industry. We need a plan to support the longer term commitment to see this succeed. These one off, where we see a few years of cow/calf harvesting isn't the goal. We need to see real change in how this is measured and supported by stakeholders and industry. The forest industry plays a critical role in the management of habitat. We need to see real change in the legislation and commitments for this to be successful

4. s.13

. Not even

sure all parties would agree of this success.

If the caribou team is really wanting to begin the engagement and provide the necessary work required for the region to support a recommendation they have little time to have this started. We are roughly 1-year away from the on-cycle regulation change, that is if we believe an open season is the way to go.

Hope this helps.

Hello Michael (Mike?),

Awesome, that all sounds good to me! I'll explain this in the precedent email to the internal meeting but we've prioritized the list of changes, many of those either changes don't have enough meat or we don't have enough time. This is the primary reason I want other peoples input to have these convos about said list.

Will follow up with a group email soon.

Thanks!
Dominica

Subject: RE: Hunting reg proposals

Hey Dominica,

Thanks for looping us in. I just had another look at the proposal tracker. I think it still captures everything I had in mind, or had heard from the public.

Oh, I did actually add one more on the list, but it's more just for us to look into, it may not result in any change. But I had heard from a few local hunters around Chetwynd that the road closure for Trapper Mtn was either not mapped correctly in the synopsis, or was implemented in a way that was ineffective. They had relayed to me that the motor vehicle closure still enable hunters to drive right close to the mountain goat habitat. I have no idea if this is the case or not, but something to look into.

Nothing for moose (relative to caribou recovery) at this point in time. We're still doing background work on that.

Keep us posted regarding meetings, etc.

Thanks!

Subject: Hunting reg proposals

Hello Joelle and Michael,

I am leading the hunting reg changes this cycle, and since it is pretty late, and I'm new, we have decided to scale it back a lot. I plan to have an internal meeting the second week in May with a bunch of our biologists, hopefully including both of you. However, I wanted to reach out to discuss what proposals you think are necessary/ a must-do for this year. I already have the Pink mountain archery in the top priorities, but any other proposals around moose, wolves, etc.? Anything that isn't in the proposal tracker?

Chris Lewis has already drafted a BH sheep proposal. So I think that is almost ready to go.

Any insight into any of this would be great! The next steps will be starting up the PAC meeting to inform FN stakeholders and the public, so that's coming soon.

Thank you,
Dominica

Hello Michel, Marianne, and Aviva,

Below is what I want to send to the internal meeting group. I just wanted to run it by you three first and let me know if there need to be any changes??

Thank you, and I hope you are all enjoying this awesome Thursday afternoon!
Dominica

Hello Everyone,

I am scheduling a meeting to discuss the upcoming hunting regulation procedures and how we will be moving forward with the 2022-2024 regulation change procedures. I am arranging this meeting to get some internal comments, advice, and suggestions on the proposed changes and explain how we will proceed with this cycle of changes. Also, there will be external meetings with FN and stakeholders to inform them on how we will be approaching this reg change, including a PAC meeting... so any help with that will be gladly accepted!

I have attached a priority list of the regulations brought forward earlier this year with a brief explanation and "to do's" for each. Please take a look at s.13 : and contact me directly about any concerns or topics you would like to discuss with these changes for this meeting (or any other not on this list!).

I have also added a Microsoft forms to find the best day and time for everyone for the second week in May.

I’m still drafting the proposal and will change numbers later. You can use the 2020 7-53 moose inventory results, Eco-Web and I are comfortable with the report and are calling it done.

Hi Michel,

I can explain this to you it’s pretty simple...I’m reading a couple of papers to see there is a more statistically sound way of going about this. I also haven’t included 748 and 750 so it’ll go up a little ...but just as a quick reference for your writing for now.

Column S to X I did super basic population calculations bases on the area of the MU...Below is the sum of each column

Thank you for the feedback/edits/comments and for Chris catching my typo that would have had an Any Bull LEH through the rut.

I've rejigged the proposal based on your comments. I would be interested in adding Dominica's regression analysis to support the comment antler configuration isn't enough.

Subject: Draft - Moose LEH reg proposal

Good afternoon Dominica, Chris, and James,

Can you take a look at the draft proposal? Feel free to edit and poke holes in the rationale. I need to keep working on the later sections (alternatives, risks, etc.) but the main rationale should be roughed in.

Michel Lavallée, M.SEM., R.P.Bio.

3. Map associated with the proposed regulation. ☐ Yes ☒ No

- This map may be used to form the regulation. It should be digital and professional. Please provide shapefiles if available.

4. Reason for proposal (rationale in plain language): IMPORTANT – this is what goes on the public engagement website (AHTE) verbatim

Moose populations are stable to declining across most of the Northeast Region. Stakeholders and First Nations are concerned about the populations ability to support First Nation sustenance harvest, licenced harvest, and non-consumptive values due to the pressures of landscape changes and hunting practices. A series of regulation changes were implemented to reduce licenced moose harvest during the last 6 years; moose populations do not appear to be stabilizing with these changes. Addressing habitat concerns is a long process and industry specific; moving moose from General Open Season to Limited Entry Hunt is intended to maintain moose harvest opportunity while providing more oversight of the number of moose harvested within the Region. Changing part of the Northeast Region to LEH while keeping other areas GOS risks moving hunters into areas with lower hunting pressure and increasing moose harvest in currently stable populations.

PART B: ANALYSIS

1. Describe surveys used for conservation issues and their results as they relate to this submission:

Moose inventory data in the Northeast Region does not have the required frequency or coverage to estimate population trends for most of the management units. The recent inventories (2015-2021), demographics, and densities were calculated for each management unit and extrapolated into management units that do not have current inventory data using available information within each Game Management Zone. The result of this work indicates the Northeast Region has 60,660 moose (minimum 47,705 and a maximum of 73,615 moose); the Northeast Region contains an estimated 16,307 (12,406 – 20,208) bulls, 33, 257 (26,375 – 40,140) cows, and 11,094 (8,923 – 13,266) calves).

Work completed by Kuzyk and colleagues in 2018¹ modelled moose population trends across the Province and found each Northeast Game Management Zone has a decreasing population trend ($\lambda < 1$) between 2006 and 2015; a change from the 1996-2005 period where only one Game Management Zone had a declining population trend. This perspective is supported by all the Northeast Region's First Nations who have indicated moose populations are decreasing and harvesting is becoming challenging. Declining hunter effort in the Big Game Harvest Survey is likely a hunter response to declining moose populations and declining success rates.

Research completed by Natcher and colleagues² in 2021 indicates First Nation communities harvest annually 2.1 – 2.4 moose per household. There is a minimum of 677 First Nation residences in the Northeast Region and an unknown number of households from transboundary First Nations (Kaska Daylu Council, Dene Tha' First Nation, Horselake First Nation, McLeod Lake Indian Band) that may hunt in the Region. Approximately 1,421 to 1,624 moose are harvested by First Nations assuming every household is actively harvesting moose and the estimate for households that don't harvest is balanced by harvest from First Nations bordering the Region. First Nations prefer to harvest bull moose to protect the cows and support a sustainable population; exceptions are made for dry cows since they did not successfully reproduce and would be harvested for sustenance purposes. The First Nation harvest distribution can be adjusted to 75% of the moose harvested are bull (1,066 – 1,218) and 25% of the harvest is are dry cows (355 – 406).

Licensed hunters harvested an estimated 1,489 moose in 2019. The combined licensed and First Nation subsistence harvest may be 2,910 – 3,113 moose annually (2,555 – 2,707 with First Nation bull harvest reduced to 75% of total harvest).

The Harvest Management Principles described in the Provincial Moose Management Framework suggest the maximum moose population growth of 15% occurs when wolf populations are controlled. A minimum of 32 calves per 100 cows is required to compensate for natural mortality. The maximum harvest rate suggested is 10-11% of the population when harvest is distributed across bulls, cows, and calves; however, First Nation subsistence practices favors harvesting bull moose and licensed harvest is restricted to bulls with further restrictions based on antler configuration. The annual estimated harvest rate between licensed hunters and First Nations is approximately 5% of the total population; this harvest level requires higher calf recruitment of 30-45 calves per 100 cows to maintain stable populations. Calf recruitment in the Northeast Region ranges from 7 calves per 100 cows (MU 7-57 in 2017) to 68 calves per 100 cows (MU 7-47 in 2016) with a regional average of 32 calves per 100 cows and has remained in this range during the last 20 years.

Kuzyk and colleagues¹ publication indicates a maximum bull harvest of 20% would be sustainable for most moose populations in the Province. Based on the current population estimates, the Northeast Region could support the harvest of 3,261 bull moose annually which is approximately equal to current harvest rates.

Local overharvesting is challenging to avoid through General Open Season since hunters have the flexibility to harvest moose based on hunter preference and access. Antler restrictions have not stabilized the moose populations; moving to Limited Entry Hunt provides the Province the ability to distribute harvest pressure across the Region to reduce the risk of overharvesting in certain areas. The proposed Any Bull LEH is intended to support hunters' opportunity to successfully harvest moose while addressing potential enforcement challenges and unlawful harvest encountered when hunters do not accurately count points on the antler. The Any Bull LEH would distribute harvest pressure across more age classes rather than the current focused harvest on young bulls (spike-fork) or older bulls (tri-palm, 10 point).

Management Units 7-21B, 7-22, and 7-31B overlap the South Peace Caribou recovery efforts and wolf control zones. Keeping these Management Units as GOS will encourage moose harvest within the caribou recovery areas and slow moose population growth.

The Moose LEH Shared hunt allows family or friends to continue moose hunting together without increasing the number of authorizations issued to support the continuation of this practice and knowledge transfer to newer hunters.

¹ Kuzyk, G., I. Hatter, S. Marshall, C. Procter, B. Cadsand, D. Lirette, H. Schindler, M. Bridger, P. Stent, A. Walker, and M. Klaczek. 2018. Moose population dynamics during 20 years of declining harvest in British Columbia. *Alces* 54:101-119

² Natcher, D., S. Ingram, A-M. Bogdan, and A. Rice. 2021. Conservation and Indigenous subsistence hunting in the Peace River Region of Canada. *Human Ecology*. 49:109-120

2. Alternatives to regulation considered:

The Northeast Region has implemented more restrictive hunting regulations to address declining moose populations, but these have not generated the expected change.

Alternatives considered:

- Current regulation structure – moose populations have been declining for over 20 years. The current regulations have been inadequate to stabilize the populations.
- The calf recruitment is low across the Region and is inadequate to stabilize the population. The main driver behind low calf recruitment and survival is predation. Increasing the wolf bag limit to 10 has been proposed and not supported since licenced hunters currently can harvest 3 wolves annually and few hunters consistently harvest wolves. Increasing the limit is unlikely to have a direct, consistent, and sustainable benefit for moose.
- Implementing a predator control program in specific Game Management Zones to enhance calf moose survival. The Management Plan for Grey Wolf (*Canis lupus*) in British Columbia is clear (section 7.4) that implementing predator control to enhance ungulate populations for hunting is contrary to policy. Licenced hunting opportunities will need to be closed before this alternative can be considered.

3. Pros/Cons analysis undertaken & results:

Pros:

- Low calf recruitment indicates moose declines are likely to continue, LEH provides the ability to collect hunter success data and adjust LEH authorizations and quota before the maximum harvest declines below current harvest levels.
- First Nations requested the Province management moose under LEH; this is responsive to their requests
- Responds to First Nations' local and traditional knowledge regarding moose populations
- The Province will need to explicitly consider First Nation Treaty 8 right to hunt when making quota and LEH decisions
- The Province would be able to distribute harvest across the region and reduce the risk of localized overharvesting
- Regional staff and Branch have more control over moose harvest and can adjust LEH authorizations to support management objectives
- Precautionary approach for management units without current inventory data to reduce risk of moose becoming a species of conservation concern

Cons:

- LEH is unlikely to stabilize or increase the moose populations without addressing habitat and predation
- Licenced hunting community harvests moose for food. A moose provides approximately 200kg of meat for the cost of a hunting licence (\$32) and species licence (\$25). Replacing moose with beef would cost over \$3,000 to purchase an equivalent weight from grocery stores.
- Licenced hunters may be upset on the reduced opportunity.
- Northeast licenced hunters will have reduced opportunity under the current LEH system
- Updating the licencing system to include the new LEH codes will take time and resources
- Additional staff time to calculate annual LEH and quota recommendations
- First Nations may expect this change will stop or reverse moose population declines
- Decreased number of hunters traveling from other Regions to the Northeast for moose hunting.

4. Identify risks of NOT implementing the new provision:

The risks associated with not implementing the regulation change could be the non-recoverable collapse of the moose population within the Peace Region. If the general open season continues to operate, the moose population may decrease past a recoverable population. Alternatively, it could lead to a recoverable population, that would require either a LEH or a closed season to allow the population to recuperate. This would also frustrate hunters and stakeholders.

If the government does not listen to the Traditional Knowledge of the local First Nations, there may be a potential violation of Treaty 8 rights, as the population of moose continues to decrease, and sustenance harvest is affected, a lawsuit may be initiated.

5. Comments by Reviewers: (if relevant)

Use separate page, as comments may not be included in the final OIC/MO Package.
Copies of email correspondence may be attached.

Subject: Additional Moose Compulsory Inspection - Guides

Good Morning Darryl,

I am reaching out to you for your thoughts on the proposed change to include Moose hunted via guides/outfitters in the 7B Region for compulsory inspections. I have drafted the proposed reg change as follows:

“Persons who use the services of a licensed guide for the purpose of hunting a mountain goat, mountain sheep, or moose in Region 7B must submit such animals for inspection within 30 days after the last day of the continuous season in which the animal was taken and by December 5 of the year of the kills, whichever occurs first.”

This would be included on page 21 under the Compulsory Inspection and Reporting title. From the enforcement side, does this raise any red flags for you?

Coming from Alberta, these compulsory checks are new to me. From my understanding, this reg change would alleviate some stress for the guides in the Northern Section of the region where Inspectors may not be as readily available.

I am available to discuss over the phone as well.

Thanks,

James Morgan

Hey James,

I just added a couple of comments to the document. ^{s.13}
s.13 Maybe just check with Michel and Steve MacIver. We could probably also add
caribou to the list, or any other CI'd species that may be relevant in other regions.

Cheers,

Mike

Subject: Moose CI Reg Change form

Good Morning Michael,

I've attached the draft version of the regulation change form for the Moose CI for Region 7B. It looks like Michel did most of the heavy lifting on the writing. I've added how I think the regulation should be included in the new regulations. If you are free in the next couple of weeks it would be great to go over this change with you to potentially beef up this document a bit more.

Let me know if there is a time I can fit in to discuss.

Sincerely,

James Morgan

Michel:

Thanks for your work on this project. The draft looks really promising and I think moving in the right direction. The clarification that is provided by Marianne's questions and your responses are really helpful. I would like to set up a meeting late next week to final our approach and to discuss and finalize the plan for engagement.

Please include yourself, Marianne, Aviva, Dominica and James Morgan for learning purposes to this meeting.

Hello Mike

Thank you for reaching out and highlighting the caribou interest.

Right now the information that has been compiled is being peer reviewed provincially to verify the data analysis is valid and suggested changes make sense from a moose management lens. Once that is done we plan to arrange a meeting with Caribou group to review the proposal and discuss options of how we may adjust it to support Caribou Program interests. At that time we can discuss the potential opportunity to add in the antlerless season as well to support Caribou. I suspect this meeting will be arranged in June.

We recognize this is a shift in management and will require engagement and increases workload.

Please keep this confidential within government at this time as it is still early stages and is being scoped out.

Respectfully

Marianne Johnson

| | 7-19, 7-20, 7-21A, 7-31A, 7-32, 7-33, 7-34, 7-35, 7-36, 7-42, 7-43, 7-46 to 7-56+ ▲ | Bulls | Oct 16 – Oct 31 |

3. Map associated with the proposed regulation. ☐ Yes ☒ No

- This map may be used to form the regulation. It should be digital and professional. Please provide shapefiles if available.

4. Reason for proposal (rationale in plain language): IMPORTANT – this is what goes on the public engagement website (AHTE) verbatim

Moose populations are stable to declining across most of the Northeast Region. Stakeholders and First Nations are concerned about the populations ability to support First Nation sustenance harvest, licenced harvest, and non-consumptive values due to the pressures of landscape changes and hunting practices. A series of regulation changes were implemented to reduce licenced moose harvest during the last 6 years; moose populations do not appear to be stabilizing with these changes. Addressing habitat concerns is a long process and industry specific; moving moose from General Open Season to Limited Entry Hunt is intended to maintain moose harvest opportunity while providing more oversight of the number of moose harvested within the Region. Changing part of the Northeast Region to LEH while keeping other areas GOS risks moving hunters into areas with lower hunting pressure and increasing moose harvest in currently stable populations. The Youth LEH season is intended to provide opportunity for youth to harvest moose before returning to school and having reduced opportunity during the remaining seasons. The two LEH opportunities (September 1 – September 30 and October 16 – October 31) are intended to balance harvest pressure before and after the rut to support reproductive success; the number of authorizations can be adjusted to maintain post-hunt bull to cow ratios. All three LEH opportunities are Any Bull to distribute harvest pressure across the different age classes and offset loss of harvest opportunity by increasing the number of moose that could be legally harvested.

s.13

PART B: ANALYSIS

1. Describe surveys used for conservation issues and their results as they relate to this submission:

Moose inventory data in the Northeast Region does not have the required frequency or coverage to estimate population trends for most of the management units. The recent inventories (2015-2021), demographics, and densities were calculated for each management unit and extrapolated into management units that do not have current inventory data using available information within each Game Management Zone. The result of this work indicates the Northeast Region has 60,660 moose (minimum 47,705 and a maximum of 73,615 moose); the Northeast Region contains an estimated 16,307 (12,406 – 20,208) bulls, 33,257 (26,375 – 40,140) cows, and 11,094 (8,923 – 13,266) calves).

Work completed by Kuzyk and colleagues in 2018¹ modelled moose population trends across the Province and found each Northeast Game Management Zone has a decreasing population trend ($\lambda < 1$) between 2006 and 2015; a change from the 1996-2005 period where only one Game Management Zone had a declining population trend. This perspective is supported by all the Northeast Region's First Nations who have indicated moose populations are decreasing and harvesting is becoming challenging. Declining hunter effort in the Big Game Harvest Survey is likely a hunter response to declining moose populations and declining success rates.

Research completed by Natcher and colleagues² in 2021 indicates First Nation communities harvest annually 2.1 – 2.4 moose per household. There is a minimum of 677 First Nation residences in the Northeast Region and an unknown number of households from transboundary First Nations (Kaska Daylu Council, Dene Tha' First Nation, Horselake First Nation, McLeod Lake Indian Band) that may hunt in the Region. Approximately 1,421 to 1,624 moose are harvested by First Nations assuming every household is actively harvesting moose and the estimate for households that don't harvest is balanced by harvest from First Nations bordering the Region. First Nations prefer to harvest bull moose to protect the cows and support a sustainable population; exceptions are made for dry cows since they did not successfully reproduce and would be harvested for sustenance purposes. The First Nation harvest distribution can be adjusted to 75% of the moose harvested are bull (1,066 – 1,218) and 25% of the harvest is are dry cows (355 – 406).

Licensed hunters harvested an estimated 1,489 moose in 2019. The combined licensed and First Nation subsistence harvest may be 2,910 – 3,113 moose annually (2,555 – 2,707 bull moose assuming First Nation bull harvest is 75% of the total First Nation harvest).

The Harvest Management Principles described in the Provincial Moose Management Framework suggest the maximum moose population growth of 15% occurs when wolf populations are controlled. A minimum of 32 calves per 100 cows is required to compensate for natural mortality. The maximum harvest rate suggested is 10-11% of the population when harvest is distributed across bulls, cows, and calves. First Nation subsistence practices favors harvesting bull moose and licensed harvest is restricted to bulls with further restrictions based on antler configuration. Even distribution across the population does not occur under the current cultural practices and regulatory requirements which requires a lower maximum allowable harvest rate to account for the selective harvest practices; a recommendation is 5% of the population (3,033 \pm 348). The annual estimated combined harvest of licensed hunters and First Nations is approximately 4.9% (ranges from 4.1% to 6.3%) of the total population. This harvest rate requires higher calf recruitment of 30-45 calves per 100 cows to maintain stable populations.

Calf recruitment in the Northeast Region ranges from 7 calves per 100 cows (MU 7-57 in 2017) to 68 calves per 100 cows (MU 7-47 in 2016) with a regional average of 32 calves per 100 cows. The regional moose recruitment has remained in this range during the last 20 years. This recruitment level indicates regional moose populations are likely to continue declining under current the wildlife management practice. Changing to LEH may provide the Province the flexibility required to maintain the bull composition and slow the population declines while long-term measures are implemented to change the main population drivers.

Kuzyk and colleagues¹ publication indicates a maximum bull harvest of 20% would be sustainable for most moose populations in the Province. Based on the current population estimates, the Northeast Region could support the harvest of 3,261 (\pm 780) bull moose annually which is approximately equal to current harvest rates.

Local overharvesting is challenging to avoid through General Open Season since hunters have the flexibility to harvest moose based on hunter preference and access. Antler restrictions have not stabilized the moose populations; moving to Limited Entry Hunt provides the Province the ability to distribute harvest pressure across the Region to reduce the risk of overharvesting in certain areas. The proposed Any Bull LEH is intended to support hunters' opportunity to successfully harvest moose while addressing potential enforcement challenges and unlawful harvest encountered when hunters do not accurately count points on the antler.

s.13

The Any Bull LEH would distribute harvest pressure across more age classes rather than the current focused harvest on young bulls (spike-fork) or older bulls (tri-palm, 10 point).

Management Units 7-21B, 7-22, and 7-31B overlap the South Peace Caribou recovery efforts and wolf control zones. Keeping these Management Units as GOS will encourage moose harvest within the caribou recovery areas and slow moose population growth.

The Moose LEH Shared hunt allows family or friends to continue moose hunting together without increasing the number of authorizations issued to support the continuation of this practice and knowledge transfer to newer hunters.

¹ Kuzyk, G., I. Hatter, S. Marshall, C. Procter, B. Cadsand, D. Lirette, H. Schindler, M. Bridger, P. Stent, A. Walker, and M. Klaczek. 2018. Moose population dynamics during 20 years of declining harvest in British Columbia. *Alces* 54:101-119

² Natcher, D., S. Ingram, A-M. Bogdan, and A. Rice. 2021. Conservation and Indigenous subsistence hunting in the Peace River Region of Canada. *Human Ecology*. 49:109-120

2. Alternatives to regulation considered:

The Northeast Region has implemented more restrictive hunting regulations to address declining moose populations, but these have not generated the expected change.

Alternatives considered:

- Current regulation structure – moose populations have been declining for over 20 years. The current regulations have been inadequate to stabilize the populations.
- The calf recruitment is low across the Region and is inadequate to stabilize the population. The main driver behind low calf recruitment and survival is predation. Increasing the wolf bag limit to 10 has been proposed and not supported since licenced hunters currently can harvest 3 wolves annually and few hunters consistently harvest wolves. Increasing the limit is unlikely to have a direct, consistent, and sustainable benefit for moose.
- Implementing a predator control program in specific Game Management Zones to enhance calf moose survival. The Management Plan for Grey Wolf (*Canis lupus*) in British Columbia is clear (section 7.4) that implementing predator control to enhance ungulate populations for hunting is contrary to policy. Licenced hunting opportunities will need to be closed before this alternative can be considered.

3. Pros/Cons analysis undertaken & results:

Pros:

- Low calf recruitment indicates moose declines are likely to continue, LEH provides the ability to collect hunter success data and adjust LEH authorizations and quota before the maximum harvest declines below current harvest levels.
- First Nations requested the Province management moose under LEH; this is responsive to their requests
- Responds to First Nations' local and traditional knowledge regarding moose populations
- The Province will need to explicitly consider First Nation Treaty 8 right to hunt when making quota and LEH decisions
- The Province would be able to distribute harvest across the region and reduce the risk of localized overharvesting
- Regional staff and Branch have more control over moose harvest and can adjust LEH authorizations to support management objectives
- Precautionary approach for management units without current inventory data to reduce risk of moose becoming a species of conservation concern

Cons:

- LEH is unlikely to stabilize or increase the moose populations without addressing habitat and predation
- Licenced hunting community harvests moose for food. A moose provides approximately 200kg of meat for the cost of a hunting licence (\$32) and species licence (\$25). There are additional, variable costs associated with hunting – fuel, travel, accommodations, cut & wrap – that are harder to incorporate since this varies between hunters. Replacing 220kg of moose meat with 220kg of beef would cost approximately \$3,370³ using beef's 2020 weighted average of \$15.31/kg.
- Licenced hunters may be upset on the reduced opportunity.
- Northeast licenced hunters will have reduced opportunity under the current LEH system
- Updating the licencing system to include the new LEH codes will take time and resources
- Additional staff time to calculate annual LEH and quota recommendations
- First Nations may expect this change will stop or reverse moose population declines
- Decreased number of hunters traveling from other Regions to the Northeast for moose hunting
- Increased harvest pressure in the other Regions that have moose general open season

s.13

³ Agriculture and Agri-Food Canada. Red Meat and Livestock Market Information – Prices. <https://www.agr.gc.ca/eng/canadas-agriculture-sectors/animal-industry/red-meat-and-livestock-market-information/prices/annual-retail-beef-and-historical-pork-prices/?id=1520539054104>

4. Identify risks of NOT implementing the new provision:

The risks associated with not implementing the regulation change could be the non-recoverable collapse of the moose population within the Peace Region. If the general open season continues to operate, the moose population may decrease past a recoverable population. Alternatively, it could lead to a recoverable population, that would require either a LEH or a closed season to allow the population to recuperate. This would also frustrate hunters and stakeholders.

If the government does not listen to the Traditional Knowledge of the local First Nations, there may be a potential violation of Treaty 8 rights, as the population of moose continues to decrease, and sustenance harvest is affected, a lawsuit may be initiated.

5. Comments by Reviewers: (if relevant)

Use separate page, as comments may not be included in the final OIC/MO Package.
Copies of email correspondence may be attached.

PART D: STAKEHOLDER CONSULTATION

ADEQUATE CONSULTATION AND ENGAGEMENT MUST BE RECORDED, OR THE FORM WILL BE RETURNED TO THE ORIGINATOR.

Please attach supporting documentation, such as letters, meeting minutes, etc.

Identify who was consulted and when consultations took place.

Who raised concerns and what was the nature of their concerns?

Has the regulation been changed to respond to Stakeholders' Concerns?

| Organization | Contact Name | Date and type of Consultation & Engagement | Supported? (If no, attach an explanation) N/A = Proposal not applicable to organization |
|---------------|--------------|--|---|
| CO Service | | | <div><input type="checkbox"/>Yes<input type="checkbox"/>No<input type="checkbox"/>N/A</div> <div>Note: CO service consultation is required BEFORE submission is sent to Wildlife & Habitat Branch. PART E: INDIGENOUS CONSULTATION AND ENGAGEMENT

Please attach supporting documentation, such as letters, meeting minutes, etc.

When did initial consultation and engagement period begin? _____

| | |
|--|--|
| a) Does this proposed change have implications (impact or of interest to) Indigenous Peoples? | <input type="checkbox"/> NO - If no, please explain _____ <input type="checkbox"/> YES - If yes, please complete items (b) to (e) if applicable _____ |
| b) Does this proposed change relate to the Calls to Action of the Truth and Reconciliation Commission? | <input type="checkbox"/> NO <input type="checkbox"/> YES - If yes, please indicate which of the calls and how _____ |

| | |
|---|--|
| <p>c) Does this proposed change relate to any of the following legal or other government obligations?</p> <ul style="list-style-type: none"> • modern treaty obligations to notify, discuss or consult, • common law consultation obligations, • contractual commitments, • under the <i>Declaration on the Rights of Indigenous Peoples Act</i>? | <p><input type="checkbox"/> NO</p> <p><input type="checkbox"/> YES – If yes, please explain how</p> <hr/> <p>Please review the following to help you with your analysis: ILR Reference Document: Indigenous Legal Relations Review of Cabinet Submissions*; UN Declaration Reference Document*; Provincial Legislation Engagement with Treaty Nations Guide</p> <p>*Note: You may have to request permission to the site from the Ministry of Attorney General.</p> |
| <p>d) Does this proposed change affect Indigenous peoples' modern or historic treaty rights or Aboriginal rights, including any Aboriginal title?</p> | <p><input type="checkbox"/> NO</p> <p><input type="checkbox"/> YES – If yes, please indicate how.</p> <p>Was the consultation sufficient for the purposes of the constitutional obligations?</p> <hr/> |
| <p>e) Have Indigenous peoples, including Indigenous organizations, been involved in the development of the proposed change, and will they be involved in its implementation?</p> | <p><input type="checkbox"/> NO - If no, please explain why not</p> <hr/> <p><input type="checkbox"/> YES - If yes, what views were expressed or how will they be sought?</p> <hr/> <p>Please review the Policy Framework for Advancing Reconciliation with Indigenous Peoples for guidance on involving Indigenous peoples in your policy development.</p> <p>If you would like further support with this section, please contact Legislative Alignment and Process.</p> |

Indigenous Peoples

We require the name of each Indigenous group engaged and individuals within the group. When did the engagement and consultation take place and in what forum (letter, fax, meeting, etc.)? What was the response or outcome of engagement (band by band or tribal association)? What might be the anticipated impact of this proposal on the Indigenous peoples ability to practice their Aboriginal Interests?

If consultation/engagement with Indigenous peoples is incomplete/ongoing indicate the anticipated completion date.

PART F: APPROVAL

**RECORD OF APPROVALS FOR REGULATION CHANGES

Hi there,

Thanks Michel for the opportunity to comment. There are many variables to consider if a region is contemplating a regulation change of this magnitude, and I do appreciate having the chance to weigh in.

I am quite time limited this week to provide a more fulsome response, but I will provide additional comments early next week.

s.13

Thanks for putting this info package together for us to review, and again. for the chance to comment.

Heidi

Subject: Request for review - R7B Moose regulation change proposal

Good afternoon,

The Northeast Region has been working through the moose data available. Dominica has used known moose densities within the different MUs and Game Management Zones to estimate moose populations where we don't have inventories or the data is too old to be reliable (excel sheet). She completed non-linear regression analysis, population, and hunting effort summaries for each GMZ.

We reviewed some recent food security research for First Nation communities along the Peace River to estimate potential First Nation moose subsistence needs in the region, Hunter Survey harvest estimates, and different ways of calculating the AAH.

We are expecting this will receive a lot of public feedback and we would like to be fairly confident we are heading in the right direction and have considered our options before starting engagement in the Northeast.

Can you review the calculations/analysis and draft regulation proposal? Feel free to contact Dominica or me if you have questions, comments, or suggested edits.

Please don't distribute these documents further.

Subject: Resource request - R7B Moose Regulation

Good afternoon Michael,

I attached an early draft of one of our Region's proposed regulation changes. We are expecting this will generate a lot of comment from stakeholders (BCWF and guide-outfitters) and the public through regional discussion and AHTE. Do you have someone available to support engagement for this proposal?

Michel Lavallée, M.SEM., R.P.Bio.

PART A: BACKGROUND

1. What is currently in the synopsis? (exact wording preferred)

| | | | |
|----------|--|--------|------------------|
| Moose | 7-21B, 7-22, 7-31B | Bulls | Aug 15 – Aug 31 |
| | 7-19, 7-20, 7-21A, 7-31A, 7-32, 7-33, 7-35, 7-36, 7-42, 7-43, 7-46 to 7-56 ▲ | Bulls | Aug 23 – Aug 31 |
| | 7-19, 7-21B, 7-22, 7-31, 7-36, 7-42, 7-43, 7-46 to 7-56+▲ | *Bulls | Sept 1 – Oct 31 |
| | 7-20, 7-21A, 7-32 to 7-35, 7-44, 7-45, 7-57, 7-58 | *Bulls | Sept 1 – Sept 30 |
| | 7-20, 7-21A, 7-32 to 7-35, 7-44, 7-45, 7-57, 7-58 | *Bulls | Oct 16 – Oct 31 |
| Bow Only | 7-20, 7-21A, 7-32 to 7-35, 7-44, 7-45, 7-57, 7-58 | *Bulls | Oct 1 – Oct 15 |

2. Briefly describe the proposed wording in the synopsis:

GOS

| | | | |
|----------|---|--------|-----------------|
| Moose | 7-21B, 7-22, 7-31B | Bulls | Aug 15 – Aug 31 |
| | 7-21B, 7-22, 7-31B | *Bulls | Sept 1 – Oct 31 |
| Bow Only | 7-20, 7-21A, 7-32 to 7-35, 7-44, 7-45, 7-57, 7-58 | *Bulls | Oct 1 – Oct 15 |

LEH

| | | | |
|--------------------|---|-------|------------------|
| Moose; youth only | 7-19, 7-20, 7-21A, 7-31A, 7-32, 7-33, 7-34, 7-35, 7-36, 7-42, 7-43, 7-46 to 7-56 ▲ | Bulls | Aug 23 – Aug 31 |
| Moose; shared hunt | 7-19, 7-20, 7-21A, 7-31A, 7-32, 7-33, 7-34, 7-35, 7-36, 7-42, 7-43, 7-46 to 7-56 ▲ | Bulls | Sept 1 – Sept 30 |
| | 7-19, 7-20, 7-21A, 7-31A, 7-32, 7-33, 7-34, 7-35, 7-36, 7-42, 7-43, 7-46 to 7-56+ ▲ | Bulls | Oct 16 – Oct 31 |

3. Map associated with the proposed regulation. ☐ Yes ☒ No

- This map may be used to form the regulation. It should be digital and professional. Please provide shapefiles if available.

4. Reason for proposal (rationale in plain language): IMPORTANT – this is what goes on the public engagement website (AHTE) verbatim

Moose populations are stable to declining across most of the Northeast Region. Stakeholders and First Nations are concerned about the populations ability to support First Nation sustenance harvest, licenced harvest, and non-consumptive values due to the pressures of landscape changes and hunting practices. A series of regulation changes were implemented to reduce licenced moose harvest during the last 6 years; moose populations do not appear to be stabilizing with these changes. Addressing habitat concerns is a long process and industry specific; moving moose from General Open Season to Limited Entry Hunt is intended to maintain moose harvest opportunity while providing more oversight of the number of moose harvested within the Region. Changing part of the Northeast Region to LEH while keeping other areas GOS risks moving hunters into areas with lower hunting pressure and increasing moose harvest in currently stable populations. The Youth LEH season is intended to provide opportunity for youth to harvest moose before returning to school and having reduced opportunity during the remaining seasons. The two LEH opportunities (September 1 – September 30 and October 16 – October 31) are intended to balance harvest pressure before and after the rut to support reproductive success; the number of authorizations can be adjusted to maintain post-hunt bull to cow ratios. All three LEH opportunities are Any Bull to distribute harvest pressure across the different age classes and offset loss of harvest opportunity by increasing the number of moose that could be legally harvested.

PART B: ANALYSIS

1. Describe surveys used for conservation issues and their results as they relate to this submission:

Moose inventory data in the Northeast Region does not have the required frequency or coverage to estimate population trends for most of the management units. The recent inventories (2015-2021), demographics, and densities were calculated for each management unit and extrapolated into management units that do not have current inventory data using available information within each Game Management Zone. The result of this work indicates the Northeast Region has 60,660 moose (minimum 47,705 and a maximum of 73,615 moose); the Northeast Region contains an estimated 16,307 (12,406 – 20,208) bulls, 33,257 (26,375 – 40,140) cows, and 11,094 (8,923 – 13,266) calves).

Work completed by Kuzyk and colleagues in 2018¹ modelled moose population trends across the Province and found each Northeast Game Management Zone has a decreasing population trend ($\lambda < 1$) between 2006 and 2015; a change from the 1996-2005 period where only one Game Management Zone had a declining population trend. This perspective is supported by all the Northeast Region's First Nations who have indicated moose populations are decreasing and harvesting is becoming challenging. Declining hunter effort in the Big Game Harvest Survey is likely a hunter response to declining moose populations and declining success rates.

Research completed by Natcher and colleagues² in 2021 indicates First Nation communities harvest annually 2.1 – 2.4 moose per household. There is a minimum of 677 First Nation residences in the Northeast Region and an unknown number of households from transboundary First Nations (Kaska Daylu Council, Dene Tha' First Nation, Horselake First Nation, McLeod Lake Indian Band) that may hunt in the Region. Approximately 1,421 to 1,624 moose are harvested by First Nations assuming every household is actively harvesting moose and the estimate for households that don't harvest is balanced by harvest from First Nations bordering the Region. First Nations prefer to harvest bull moose to protect the cows and support a sustainable population; exceptions are made for dry cows since they did not successfully reproduce and would be harvested for sustenance purposes. The First Nation harvest distribution can be adjusted to 75% of the moose harvested are bull (1,066 – 1,218) and 25% of the harvest is are dry cows (355 – 406).

Licensed hunters harvested an estimated 1,489 moose in 2019. The combined licensed and First Nation subsistence harvest may be 2,910 – 3,113 moose annually (2,555 – 2,707 bull moose assuming First Nation bull harvest is 75% of the total First Nation harvest).

The Harvest Management Principles described in the Provincial Moose Management Framework suggest the maximum moose population growth of 15% occurs when wolf populations are controlled. A minimum of 32 calves per 100 cows is required to compensate for natural mortality. The maximum harvest rate suggested is 10-11% of the population when harvest is distributed across bulls, cows, and calves. First Nation subsistence practices favors harvesting bull moose and licensed harvest is restricted to bulls with further restrictions based on antler configuration. Even distribution across the population does not occur under the current cultural practices and regulatory requirements which requires a lower maximum allowable harvest rate to account for the selective harvest practices; a recommendation is 5% of the population (3,033 \pm 348). The annual estimated combined harvest of licensed hunters and First Nations is approximately 4.9% (ranges from 4.1% to 6.3%) of the total population. This harvest rate requires higher calf recruitment of 30-45 calves per 100 cows to maintain stable populations.

Calf recruitment in the Northeast Region ranges from 7 calves per 100 cows (MU 7-57 in 2017) to 68 calves per 100 cows (MU 7-47 in 2016) with a regional average of 32 calves per 100 cows. The regional moose recruitment has remained in this range during the last 20 years. This recruitment level indicates regional moose populations are likely to continue declining under current the wildlife management practice. Changing to LEH may provide the Province the flexibility required to maintain the bull composition and slow the population declines while long-term measures are implemented to change the main population drivers.

Kuzyk and colleagues¹ publication indicates a maximum bull harvest of 20% would be sustainable for most moose populations in the Province. Based on the current population estimates, the Northeast Region could support the harvest of 3,261 (\pm 780) bull moose annually which is approximately equal to current harvest rates.

Local overharvesting is challenging to avoid through General Open Season since hunters have the flexibility to harvest moose based on hunter preference and access. Antler restrictions have not stabilized the moose populations; moving to Limited Entry Hunt provides the Province the ability to distribute harvest pressure across the Region to reduce the risk of overharvesting in certain areas. The proposed Any Bull LEH is intended to support hunters' opportunity to successfully harvest moose while addressing potential enforcement challenges and unlawful harvest encountered when hunters do not accurately count points on the antler.

The Any Bull LEH would distribute harvest pressure across more age classes rather than the current focused harvest on young bulls (spike-fork) or older bulls (tri-palm, 10 point).

Management Units 7-21B, 7-22, and 7-31B overlap the South Peace Caribou recovery efforts and wolf control zones. Keeping these Management Units as GOS will encourage moose harvest within the caribou recovery areas and slow moose population growth.

The Moose LEH Shared hunt allows family or friends to continue moose hunting together without increasing the number of authorizations issued to support the continuation of this practice and knowledge transfer to newer hunters.

¹ Kuzyk, G., I. Hatter, S. Marshall, C. Procter, B. Cadsand, D. Lirette, H. Schindler, M. Bridger, P. Stent, A. Walker, and M. Klaczek. 2018. Moose population dynamics during 20 years of declining harvest in British Columbia. *Alces* 54:101-119

² Natcher, D., S. Ingram, A-M. Bogdan, and A. Rice. 2021. Conservation and Indigenous subsistence hunting in the Peace River Region of Canada. *Human Ecology*. 49:109-120

2. Alternatives to regulation considered:

The Northeast Region has implemented more restrictive hunting regulations to address declining moose populations, but these have not generated the expected change.

Alternatives considered:

- Current regulation structure – moose populations have been declining for over 20 years. The current regulations have been inadequate to stabilize the populations.
 - The calf recruitment is low across the Region and is inadequate to stabilize the population. The main driver behind low calf recruitment and survival is predation. Increasing the wolf bag limit to 10 has been proposed and not supported since licenced hunters currently can harvest 3 wolves annually and few hunters consistently harvest wolves. Increasing the limit is unlikely to have a direct, consistent, and sustainable benefit for moose.
 - Implementing a predator control program in specific Game Management Zones to enhance calf moose survival. The Management Plan for Grey Wolf (*Canis lupus*) in British Columbia is clear (section 7.4) that implementing predator control to enhance ungulate populations for hunting is contrary to policy. Licenced hunting opportunities will need to be closed before this alternative can be considered.
-

3. Pros/Cons analysis undertaken & results:

Pros:

- Low calf recruitment indicates moose declines are likely to continue, LEH provides the ability to collect hunter success data and adjust LEH authorizations and quota before the maximum harvest declines below current harvest levels.
- First Nations requested the Province management moose under LEH; this is responsive to their requests
- Responds to First Nations' local and traditional knowledge regarding moose populations
- The Province will need to explicitly consider First Nation Treaty 8 right to hunt when making quota and LEH decisions
- The Province would be able to distribute harvest across the region and reduce the risk of localized overharvesting
- Regional staff and Branch have more control over moose harvest and can adjust LEH authorizations to support management objectives
- Precautionary approach for management units without current inventory data to reduce risk of moose becoming a species of conservation concern

Cons:

- LEH is unlikely to stabilize or increase the moose populations without addressing habitat and predation
 - Licenced hunting community harvests moose for food. A moose provides approximately 200kg of meat for the cost of a hunting licence (\$32) and species licence (\$25). There are additional, variable costs associated with hunting – fuel, travel, accommodations, cut & wrap – that are harder to incorporate since this varies between hunters. Replacing 220kg of moose meat with 220kg of beef would cost approximately \$3,370³ using beef's 2020 weighted average of \$15.31/kg.
 - Licenced hunters may be upset on the reduced opportunity.
 - Northeast licenced hunters will have reduced opportunity under the current LEH system
 - Updating the licencing system to include the new LEH codes will take time and resources
 - Additional staff time to calculate annual LEH and quota recommendations
 - First Nations may expect this change will stop or reverse moose population declines
 - Decreased number of hunters traveling from other Regions to the Northeast for moose hunting
 - Increased harvest pressure in the other Regions that have moose general open season
-

4. Identify risks of NOT implementing the new provision:

The risks associated with not implementing the regulation change could be the non-recoverable collapse of the moose population within the Peace Region. If the general open season continues to operate, the moose population may decrease past a recoverable population. Alternatively, it could lead to a recoverable population, that would require either a LEH or a closed season to allow the population to recuperate. This would also frustrate hunters and stakeholders.

If the government does not listen to the Traditional Knowledge of the local First Nations, there may be a potential violation of Treaty 8 rights, as the population of moose continues to decrease, and sustenance harvest is affected, a lawsuit may be initiated.

5. Comments by Reviewers: *(if relevant)*

Use separate page, as comments may not be included in the final OIC/MO Package.

Hi Marianne

We are finalizing our detailed proposal, but I have attached the table of our summarized proposals we talked about on previous calls.

I will be sending out some alternate dates for our FWWG meeting.

Thanks

Norm

Hello Norm

For the July meeting please add 2022-2024 NE Region Hunting Regulation change proposals to the agenda.

Also I do not recollect receiving the request for changes from Kaska. Was that sent to us in the NE Region and I just missed it?

Respectfully

Marianne Johnson

3. Map associated with the proposed regulation. ☐ Yes ☒ No

- This map may be used to form the regulation. It should be digital and professional. Please provide shapefiles if available.

4. Reason for proposal (rationale in plain language): IMPORTANT – this is what goes on the public engagement website (AHTE) verbatim

Moose populations are stable to declining across most of the Northeast Region. Stakeholders and First Nations are concerned about the populations ability to support First Nation sustenance harvest, licenced harvest, and non-consumptive values due to the pressures of landscape changes and hunting practices. A series of regulation changes were implemented to reduce licenced moose harvest during the last 6 years; moose populations do not appear to be stabilizing with these changes. Addressing habitat concerns is a long process and industry specific; moving moose from General Open Season to Limited Entry Hunt is intended to maintain moose harvest opportunity while providing more oversight of the humber of moose harvested within the Region. Changing part of the Northeast Region to LEH while keeping other areas GOS risks moving hunters into areas with lower hunting pressure and increasing moose harvest in currently stable populations. The Youth LEH season is intended to provide opportunity for youth to harvest moose before returning to school and having reduced opportunity during the remaining seasons. The two LEH opportunities (September 1 – September 30 and October 16 – October 31) are intended to balance harvest pressure before and after the rut to support reproductive success; the number of authorizations can be adjusted to maintain post-hunt bull to cow ratios. All three LEH opportunities are Any Bull to distribute harvest pressure across the different age classes and offset loss of harvest opportunity by increasing the number of moose that could be legally harvested.

s.13

PART B: ANALYSIS

1. Describe surveys used for conservation issues and their results as they relate to this submission:

Moose inventory data in the Northeast Region does not have the required frequency or coverage to estimate population trends for most of the management units. The recent inventories (2015-2021), demographics, and densities were calculated for each management unit and extrapolated into management units that do not have current inventory data using available information within each Game Management Zone. The result of this work indicates the Northeast Region has 60,660 moose (minimum 47,705 and a maximum of 73,615 moose); the Northeast Region contains an estimated 16,307 (12,406 – 20,208) bulls, 33,257 (26,375 – 40,140) cows, and 11,094 (8,923 – 13,266) calves).

Work completed by Kuzyk and colleagues in 2018¹ modelled moose population trends across the Province and found each Northeast Game Management Zone has a decreasing population trend ($\lambda < 1$) between 2006 and 2015; a change from the 1996-2005 period where only one Game Management Zone had a declining population trend. This perspective is supported by all the Northeast Region's First Nations who have indicated moose populations are decreasing and harvesting is becoming challenging. Declining hunter effort in the Big Game Harvest Survey is likely a hunter response to declining moose populations and declining success rates.

Research completed by Natcher and colleagues² in 2021 indicates First Nation communities harvest annually 2.1 – 2.4 moose per household. There is a minimum of 677 First Nation residences in the Northeast Region and an unknown number of households from transboundary First Nations (Kaska Daylu Council, Dene Tha' First Nation, Horselake First Nation, McLeod Lake Indian Band) that may hunt in the Region. Approximately 1,421 to 1,624 moose are harvested by First Nations assuming every household is actively harvesting moose and the estimate for households that don't harvest is balanced by harvest from First Nations bordering the Region. First Nations prefer to harvest bull moose to protect the cows and support a sustainable population; exceptions are made for dry cows since they did not successfully reproduce and would be harvested for sustenance purposes. The First Nation harvest distribution can be adjusted to 75% of the moose harvested are bull (1,066 – 1,218) and 25% of the harvest is are dry cows (355 – 406).

Licensed hunters harvested an estimated 1,489 moose in 2019. The combined licensed and First Nation subsistence harvest may be 2,910 – 3,113 moose annually (2,555 – 2,707 bull moose assuming First Nation bull harvest is 75% of the total First Nation harvest).

The Harvest Management Principles described in the Provincial Moose Management Framework suggest the maximum moose population growth of 15% occurs when wolf populations are controlled. A minimum of 32 calves per 100 cows is required to compensate for natural mortality. The maximum harvest rate suggested is 10-11% of the population when harvest is distributed across bulls, cows, and calves. First Nation subsistence practices favors harvesting bull moose and licensed harvest is restricted to bulls with further restrictions based on antler configuration. Even distribution across the population does not occur under the current cultural practices and regulatory requirements which requires a lower maximum allowable harvest rate to account for the selective harvest practices; a recommendation is 5% of the population (3,033 ± 348). The annual estimated combined harvest of licensed hunters and First Nations is approximately 4.9% (ranges from 4.1% to 6.3%) of the total population. This harvest rate requires higher calf recruitment of 30-45 calves per 100 cows to maintain stable populations.

Calf recruitment in the Northeast Region ranges from 7 calves per 100 cows (MU 7-57 in 2017) to 68 calves per 100 cows (MU 7-47 in 2016) with a regional average of 32 calves per 100 cows. The regional moose recruitment has remained in this range during the last 20 years. This recruitment level indicates regional moose populations are likely to continue declining under current the wildlife management practice. Changing to LEH may provide the Province the flexibility required to maintain the bull composition and slow the population declines while long-term measures are implemented to change the main population drivers.

Kuzyk and colleagues¹ publication indicates a maximum bull harvest of 20% would be sustainable for most moose populations in the Province. Based on the current population estimates, the Northeast Region could support the harvest of 3,261 (± 780) bull moose annually which is approximately equal to current harvest rates.

Local overharvesting is challenging to avoid through General Open Season since hunters have the flexibility to harvest moose based on hunter preference and access. Antler restrictions have not stabilized the moose populations; moving to Limited Entry Hunt provides the Province the ability to distribute harvest pressure across the Region to reduce the risk of overharvesting in certain areas. The proposed Any Bull LEH is intended to support hunters' opportunity to successfully harvest moose while addressing potential enforcement challenges and unlawful harvest encountered when hunters do not accurately count points on the antler.

The Any Bull LEH would distribute harvest pressure across more age classes rather than the current focused harvest on young bulls (spike-fork) or older bulls (tri-palm, 10 point).

Management Units 7-21B, 7-22, and 7-31B overlap the South Peace Caribou recovery efforts and wolf control zones. Keeping these Management Units as GOS will encourage moose harvest within the caribou recovery areas and slow moose population growth.

The Moose LEH Shared hunt allows family or friends to continue moose hunting together without increasing the number of authorizations issued to support the continuation of this practice and knowledge transfer to newer hunters.

¹ Kuzyk, G., I. Hatter, S. Marshall, C. Procter, B. Cadsand, D. Lirette, H. Schindler, M. Bridger, P. Stent, A. Walker, and M. Klaczek.

² Natcher, D., S. Ingram, A-M. Bogdan, and A. Rice. 2021. Conservation and Indigenous subsistence hunting in the Peace River Region of Canada. *Human Ecology*. 49:109-120

2. Alternatives to regulation considered:

The Northeast Region has implemented more restrictive hunting regulations to address declining moose populations, but these have not generated the expected change.

Alternatives considered:

- Current regulation structure – moose populations have been declining for over 20 years. The current regulations have been inadequate to stabilize the populations.
- The calf recruitment is low across the Region and is inadequate to stabilize the population. The main driver behind low calf recruitment and survival is predation. Increasing the wolf bag limit to 10 has been proposed and not supported since licenced hunters currently can harvest 3 wolves annually and few hunters consistently harvest wolves. Increasing the limit is unlikely to have a direct, consistent, and sustainable benefit for moose.
- Implementing a predator control program in specific Game Management Zones to enhance calf moose survival. The Management Plan for Grey Wolf (*Canis lupus*) in British Columbia is clear (section 7.4) that implementing predator control to enhance ungulate populations for hunting is contrary to policy. Licenced hunting opportunities will need to be closed before this alternative can be considered.

3. Pros/Cons analysis undertaken & results:

Pros:

- Low calf recruitment indicates moose declines are likely to continue, LEH provides the ability to collect hunter success data and adjust LEH authorizations and quota before the maximum harvest declines below current harvest levels.
- First Nations requested the Province management moose under LEH; this is responsive to their requests
- Responds to First Nations' local and traditional knowledge regarding moose populations
- The Province will need to explicitly consider First Nation Treaty 8 right to hunt when making quota and LEH decisions
- The Province would be able to distribute harvest across the region and reduce the risk of localized overharvesting
- Regional staff and Branch have more control over moose harvest and can adjust LEH authorizations to support management objectives
- Precautionary approach for management units without current inventory data to reduce risk of moose becoming a species of conservation concern

Cons:

- LEH is unlikely to stabilize or increase the moose populations without addressing habitat and predation
- Licenced hunting community harvests moose for food. A moose provides approximately 200kg of meat for the cost of a hunting licence (\$32) and species licence (\$25). There are additional, variable costs associated with hunting – fuel, travel, accommodations, cut & wrap – that are harder to incorporate since this varies between hunters. Replacing 220kg of moose meat with 220kg of beef would cost approximately \$3,370³ using beef's 2020 weighted average of \$15.31/kg.
- Licenced hunters may be upset on the reduced opportunity.
- Northeast licenced hunters will have reduced opportunity under the current LEH system
- Updating the licencing system to include the new LEH codes will take time and resources
- Additional staff time to calculate annual LEH and quota recommendations
- First Nations may expect this change will stop or reverse moose population declines
- Decreased number of hunters traveling from other Regions to the Northeast for moose hunting
- Increased harvest pressure in the other Regions that have moose general open season

³ Agriculture and Agri-Food Canada. Red Meat and Livestock Market Information – Prices. <https://www.agr.gc.ca/eng/canadas-agriculture-sectors/animal-industry/red-meat-and-livestock-market-information/prices/annual-retail-beef-and-historical-pork-prices/?id=1520539054104>

4. Identify risks of NOT implementing the new provision:

The risks associated with not implementing the regulation change could be the non-recoverable collapse of the moose population within the Peace Region. If the general open season continues to operate, the moose population may decrease past a recoverable population. Alternatively, it could lead to a recoverable population, that would require either a LEH or a closed season to allow the population to recuperate. This would also frustrate hunters and stakeholders.

If the government does not listen to the Traditional Knowledge of the local First Nations, there may be a potential violation of Treaty 8 rights, as the population of moose continues to decrease, and sustenance harvest is affected, a lawsuit may be initiated.

5. Comments by Reviewers: (if relevant)

Use separate page, as comments may not be included in the final OIC/MO Package.
Copies of email correspondence may be attached.

PART D: STAKEHOLDER CONSULTATION

ADEQUATE CONSULTATION AND ENGAGEMENT MUST BE RECORDED, OR THE FORM WILL BE RETURNED TO THE ORIGINATOR.

Please attach supporting documentation, such as letters, meeting minutes, etc.

Identify who was consulted and when consultations took place.

Who raised concerns and what was the nature of their concerns?

Has the regulation been changed to respond to Stakeholders' Concerns?

*Portion of MUs 7-52 and 7-53 closed to moose hunting from Oct 1 to Oct 15 (See Maps H27 and H28).

*MU 7-51 complete closure within Moose lake boundary (See Map 9)

3. Map associated with the proposed regulation. ☒ Yes ☐ No

- This map may be used to form the regulation. It should be digital and professional. Please provide shapefiles if available.

4. Reason for proposal (rationale in plain language): IMPORTANT – this is what goes on the public engagement website (AHTE) verbatim

The Kaska Dena have expressed concerns over the last several decades on licenced hunting pressure in culturally important areas. Since the establishment of the Kaska BC Natural Resource Council, High Cultural Use Areas have been identified as a management concern related to hunting pressures, land use conflicts, and surface/subsurface dispositions. The Moose Lakes have been classified as High Cultural Use Areas. All the areas listed above are located near Kaska communities and are of spiritual, historic, cultural, social, and environmental importance to the Kaska Dena. These areas are the location of culture camps, family cabins and camps, are used to meet sustenance needs, and maintain and exercise traditional practices and cultural

uses. It is important to note these are not all the High Cultural Use Areas in the traditional territory but are candidate areas to work collaboratively to address the conflicts. They could be considered as pilot areas for further management actions in the traditional territory. These areas are of such importance to the communities that Kaska Dena have placed signs near these areas to communicate to licenced hunters about hunting in the areas. These signs are not throughout the territory but a key place such as the above list.

Guide outfitters in the area have also expressed concern regarding overcrowding of resident hunters in the Moose Lakes area. There are safety concerns associated with overcrowding voiced by Conservation officers, First Nations and Guide outfitters. Public safety becomes a major concern and top priority.

From a conservation perspective there is limited data regarding the population levels in the area. The last survey was completed in 2012/2013. The corrected population density for the entire MU 7-51 was 0.61 moose/km² which is considered a high-density population (above 0.2 moose per squared km; Poole and Demars (2015). We do acknowledge this justification regarding this proposal is not a conservation concern but meant to support First Nations harvest and tradiational, while reducing hunter crowding and localized harvest pressure.

Despite the social nature of this rationale there's a three-pronged justification for this proposal. Firstly, in the spirit of reconciliation and because of the classification of Moose Lake to be as High Cultural Use area this complete closure would align with First Nation's interest and request. Second, due to the GOS nature of the North East, hunter overcrowding has been a safety concern for some time. Therefore, this closure would help mitigate this risk. Lastly, the area is quite small and therefore the impact felt to stakeholders is not a significant as the implementation of an entire MU closure.

What is the problem or issue that the regulation change is intended to address or resolve?

Why is government action required at this time?

Write at a professional level. This document may be part of the OIC/MO package and is subject to FOI requests.

s.13

PART B: ANALYSIS

1. Describe surveys used for conservation issues and their results as they relate to this submission:

As mentioned previously this is not a conservation issue. Zone 7-51 A (Map 9) is a small area of MU 7-51, therefore 7-51A population statistics are would be estimates. As to be transparent, we report the population data of MU 7-51 from the 2012/2013 survey: corrected density of 0.61, calf/cow ratio of 0.22 and bull cow ratio of 1.05.

s.13

What were the results of scientific surveys? For example, what population monitoring techniques were used? Anecdotal (hunter comments) and/or scientific information can be used. Be brief and write in plain language. Doesn't require a lot of technical detail. (Reports, technical data can be sent as an attachment.)

2. Alternatives to regulation considered:

Option 1: Close during early season Aug 23 to 31 when moose are potentially more vulnerable. This is an alternative that could potentially increase hunter density even further during the later season

Option 2: Do not implement closure.

If no alternatives were considered, explain why.

What other methods of regulation were considered and rejected and why? (e.g., voluntary codes, self-management, partnerships, etc.)

Could other bodies outside of government ensure standards are met? (e.g., accreditation, certification, auditing, etc.)

3. Pros/Cons analysis undertaken & results:

Pros

- Community members meeting moose sustenance needs in the late summer and fall
- Reduced land use conflicts between licenced hunters and community members during the hunting season
- Reduced conflicts of camps, cabins, and cultural areas being used by licenced hunting camps
- Reduced crowding of hunters
- Protection or avoidance of cultural camps, traditional areas and ensuring the exercising of traditional practices
- Reduced vulnerability of moose, especially bulls, during the rut
- Increased potential for moose to successfully breed and calve in low density northern populations
- A diversity of hunting opportunities and recreational opportunities

Cons

- Complete closure to resident hunters not in their best interest
- Very restrictive measures not fully supported by data

Explain how the benefits outweigh the costs. An example of a pro would be an increase in recreational opportunity or reduced costs. An example of a con would be impact on species population or increased regulatory complexity.

Can the costs or benefits for proposed regulation be quantified? What factors were evaluated to determine this impact?

3. Identify risks of NOT implementing the new provision:

Public safety concerns associated with over crowding of resident hunters.

Eroding FN relationships and trust associated with lack of actions regarding their conservation and cultural concerns

s.13

'Risk' is the potential of loss or damage resulting from a decision. Risks would include conservation issues and relationships with stakeholders. Describe the "worst case scenario". (A risk in the broadest sense is the potential for loss. Risk may be represented by any unintentional event or situation that leads to harm for an organization, group, habitat, species, or individual. The loss might be as simple as the pain of a twisted ankle or as complex as a liability claim ending in a lawsuit.)

5. Comments by Reviewers: (if relevant)

Use separate page, as comments may not be included in the final OIC/MO Package.
Copies of email correspondence may be attached.

PART D: STAKEHOLDER CONSULTATION

ADEQUATE CONSULTATION AND ENGAGEMENT MUST BE RECORDED, OR THE FORM WILL BE RETURNED TO THE ORIGINATOR.

Please attach supporting documentation, such as letters, meeting minutes, etc.

Identify who was consulted and when consultations took place.

Who raised concerns and what was the nature of their concerns?

Has the regulation been changed to respond to Stakeholders' Concerns?

| Organization | Contact Name | Date and type of Consultation & Engagement | Supported? (If no, attach an explanation) N/A = Proposal not applicable to organization |
|---------------|--------------|--|---|
| CO Service | | | <input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A Note: CO service consultation is required BEFORE submission is sent to Wildlife & Habitat Branch. Only rarely is this consultation not required. COS verification is required for safety related regulation proposals. |
| Other Regions | | | <input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A |

| <p>e) Have Indigenous peoples, including Indigenous organizations, been involved in the development of the proposed change, and will they be involved in its implementation?</p> | <p><input type="checkbox"/> NO - If no, please explain why not</p> <hr/> <p><input type="checkbox"/> YES - If yes, what views were expressed or how will they be sought?</p> <hr/> <p>Please review the Policy Framework for Advancing Reconciliation with Indigenous Peoples for guidance on involving Indigenous peoples in your policy development.</p> <p>If you would like further support with this section, please contact Legislative Alignment and Process.</p> |

Indigenous Peoples

We require the name of each Indigenous group engaged and individuals within the group. When did the engagement and consultation take place and in what forum (letter, fax, meeting, etc.)? What was the response or outcome of engagement (band by band or tribal association)? What might be the anticipated impact of this proposal on the Indigenous peoples ability to practice their Aboriginal Interests?

If consultation/engagement with Indigenous peoples is incomplete/ongoing indicate the anticipated completion date.

Contact: Michel Lavallee Phone: 778-576-1139 Region: 7B Northeast

SUBJECT: Amend Compulsory Inspection for Guide Outfitter

Management Units: Province Date of Submission: October 1, 2021

Species: Moose (*Alces alces*)

Choose applicable one(s): General Open Season ☐ Limited Entry Hunting ☐ Trapping ☐
Motor Vehicle Prohibition ☐ Firearm Restriction ☒ Other (describe) Add moose to Compulsory
Inspection extension for guide-outfitters (Hunting Regulation Division 6 section 2.2(b))

Who is the regional contact for communications issues?

(someone with authority to deal with media requests if requested by Public Affairs)

Name: Greg Van Dolah Phone: 250-795-4158

PART A: BACKGROUND

1. What is currently in the synopsis? (exact wording preferred)

Persons who use the services of a licensed guide for the purpose of hunting a mountain goat or mountain sheep must submit such animals for inspection within 30 days after the last day of the continuous season in which the animal was taken and by December 5 of the year of the kills, whichever occurs first.

Page 21, bullet #4.

2. Briefly describe the proposed wording in the synopsis:

Persons who use the services of a licensed guide for the purpose of hunting a mountain goat, mountain sheep, **or moose** (Regions 6 and 7B only) must submit such animals for inspection within 30 days after the last day of the continuous season in which the animal was taken and by December 5 of the year of the kills, whichever occurs first.

Page 21, bullet #4.

3. Map associated with the proposed regulation. ☐ Yes ☒ No

4. Reason for proposal (rationale in plain language): IMPORTANT – this is what goes on the public engagement website (AHTE) verbatim

The Compulsory Inspection Division of the *Hunting Regulation* has been updated to include additional species requiring compulsory inspection. The section providing guide-outfitters additional time to transport the required parts to a compulsory inspector has not been updated to include moose.

PART B: ANALYSIS

1. Describe surveys used for conservation issues and their results as they relate to this submission:

No conservation concerns or surveys are associated with this proposal. Guide-Outfitters have extended compulsory inspection timelines to accommodate their business practices and the challenges transporting the required parts to a compulsory inspector within the required time frame. Three Management Units in Region 7B are remote and the nearest compulsory inspectors are not easily accessed by the guide outfitters; similar access concerns may occur in Region 6.

2. Alternatives to regulation considered:

Leaving the current regulation requiring guide outfitters to transport the required parts to a compulsory inspector within 30 days of harvest. This may pose a compliance challenge for guides operating in remote areas during their busy season.

3. Pros/Cons analysis undertaken & results:

Leaving the current regulation requiring guide outfitters to transport the required parts to a compulsory inspector within 30 days of harvest. This may pose a compliance challenge for guides operating in remote areas during their busy season.

4. Identify risks of NOT implementing the new provision:

Impacts to guide-outfitter business if trips to compulsory inspectors are required within 30 days during the hunting season.

5. Comments by Reviewers: (if relevant)

Use separate page, as comments may not be included in the final OIC/MO Package.
Copies of email correspondence may be attached.

PART D: STAKEHOLDER CONSULTATION

ADEQUATE CONSULTATION AND ENGAGEMENT MUST BE RECORDED, OR THE FORM WILL BE RETURNED TO THE ORIGINATOR.

3. Map associated with the proposed regulation. ☐ Yes ☒ No

- This map may be used to form the regulation. It should be digital and professional. Please provide shapefiles if available.

4. Reason for proposal (rationale in plain language): IMPORTANT – this is what goes on the public engagement website (AHTE) verbatim

Moose populations are stable to declining across most of the Northeast Region. Stakeholders and First Nations are concerned about the populations ability to support First Nation sustenance harvest, licenced harvest, and non-consumptive values due to the pressures of landscape changes and hunting practices. A series of regulation changes were implemented to reduce licenced moose harvest during the last 6 years; moose populations do not appear to be stabilizing with these changes. Addressing habitat concerns is a long process and industry specific; moving moose from General Open Season to Limited Entry Hunt is intended to maintain moose harvest opportunity while providing more oversight of the number of moose harvested within the Region. Changing part of the Northeast Region to LEH while keeping other areas GOS risks moving hunters into areas with lower hunting pressure and increasing moose harvest in currently stable populations. The Youth LEH season is intended to provide opportunity for youth to harvest moose before returning to school and having reduced opportunity during the remaining seasons. The two LEH opportunities (September 1 – September 30 and October 16 – October 31) are intended to balance harvest pressure before and after the rut to support reproductive success; the number of authorizations can be adjusted to maintain post-hunt bull to cow ratios. All three LEH opportunities are Any Bull to distribute harvest pressure across the different age classes and offset loss of harvest opportunity by increasing the number of moose that could be legally harvested.

PART B: ANALYSIS

1. Describe surveys used for conservation issues and their results as they relate to this submission:

Moose inventory data in the Northeast Region does not have the required frequency or coverage to estimate population trends for most of the management units. The recent inventories (2015-2021), demographics, and densities were calculated for each management unit and extrapolated into management units that do not have current inventory data using available information within each Game Management Zone. The result of this work indicates the Northeast Region has 60,660 moose (minimum 47,705 and a maximum of 73,615 moose); the Northeast Region contains an estimated 16,307 (12,406 – 20,208) bulls, 33,257 (26,375 – 40,140) cows, and 11,094 (8,923 – 13,266) calves).

Work completed by Kuzyk and colleagues in 2018¹ modelled moose population trends across the Province and found each Northeast Game Management Zone has a decreasing population trend ($\lambda < 1$) between 2006 and 2015; a change from the 1996-2005 period where only one Game Management Zone had a declining population trend. This perspective is supported by all the Northeast Region's First Nations who have indicated moose populations are decreasing and harvesting is becoming challenging. Declining hunter effort in the Big Game Harvest Survey is likely a hunter response to declining moose populations and declining success rates.

Research completed by Natcher and colleagues² in 2021 indicates First Nation communities harvest annually 2.1 – 2.4 moose per household. There is a minimum of 677 First Nation residences in the Northeast Region and an unknown number of households from transboundary First Nations (Kaska Daylu Council, Dene Tha' First Nation, Horselake First Nation, McLeod Lake Indian Band) that may hunt in the Region. Approximately 1,421 to 1,624 moose are harvested by First Nations assuming every household is actively harvesting moose and the estimate for households that don't harvest is balanced by harvest from First Nations bordering the Region. First Nations prefer to harvest bull moose to protect the cows and support a sustainable population; exceptions are made for dry cows since they did not successfully reproduce and would be harvested for sustenance purposes. The First Nation harvest distribution can be adjusted to 75% of the moose harvested are bull (1,066 – 1,218) and 25% of the harvest is are dry cows (355 – 406).

Licensed hunters harvested an estimated 1,489 moose in 2019. The combined licensed and First Nation subsistence harvest may be 2,910 – 3,113 moose annually (2,555 – 2,707 bull moose assuming First Nation bull harvest is 75% of the total First Nation harvest).

The Harvest Management Principles described in the Provincial Moose Management Framework suggest the maximum moose population growth of 15% occurs when wolf populations are controlled. A minimum of 32 calves per 100 cows is required to compensate for natural mortality. The maximum harvest rate suggested is 10-11% of the population when harvest is distributed across bulls, cows, and calves. First Nation subsistence practices favors harvesting bull moose and licensed harvest is restricted to bulls with further restrictions based on antler configuration. Even distribution across the population does not occur under the current cultural practices and regulatory requirements which requires a lower maximum allowable harvest rate to account for the selective harvest practices; a recommendation is 5% of the population (3,033 ± 348). The annual estimated combined harvest of licensed hunters and First Nations is approximately 4.9% (ranges from 4.1% to 6.3%) of the total population. This harvest rate requires higher calf recruitment of 30-45 calves per 100 cows to maintain stable populations.

Calf recruitment in the Northeast Region ranges from 7 calves per 100 cows (MU 7-57 in 2017) to 68 calves per 100 cows (MU 7-47 in 2016) with a regional average of 32 calves per 100 cows. The regional moose recruitment has remained in this range during the last 20 years. This recruitment level indicates regional moose populations are likely to continue declining under current the wildlife management practice. Changing to LEH may provide the Province the flexibility required to maintain the bull composition and slow the population declines while long-term measures are implemented to change the main population drivers.

Kuzyk and colleagues¹ publication indicates a maximum bull harvest of 20% would be sustainable for most moose populations in the Province. Based on the current population estimates, the Northeast Region could support the harvest of 3,261 (± 780) bull moose annually which is approximately equal to current harvest rates.

Local overharvesting is challenging to avoid through General Open Season since hunters have the flexibility to harvest moose based on hunter preference and access. Antler restrictions have not stabilized the moose populations; moving to Limited Entry Hunt provides the Province the ability to distribute harvest pressure across the Region to reduce the risk of overharvesting in certain areas. The proposed Any Bull LEH is intended to support hunters' opportunity to successfully harvest moose while addressing potential enforcement challenges and unlawful harvest encountered when hunters do not accurately count points on the antler.

The Any Bull LEH would distribute harvest pressure across more age classes rather than the current focused harvest on young bulls (spike-fork) or older bulls (tri-palm, 10 point).

Management Units 7-21B, 7-22, and 7-31B overlap the South Peace Caribou recovery efforts and wolf control zones. Keeping these Management Units as GOS will encourage moose harvest within the caribou recovery areas and slow moose population growth.

The Moose LEH Shared hunt allows family or friends to continue moose hunting together without increasing the number of authorizations issued to support the continuation of this practice and knowledge transfer to newer hunters.

¹ Kuzyk, G., I. Hatter, S. Marshall, C. Procter, B. Cadsand, D. Lirette, H. Schindler, M. Bridger, P. Stent, A. Walker, and M. Klaczek. 2018. Moose population dynamics during 20 years of declining harvest in British Columbia. *Alces* 54:101-119

² Natcher, D., S. Ingram, A-M. Bogdan, and A. Rice. 2021. Conservation and Indigenous subsistence hunting in the Peace River Region of Canada. *Human Ecology*. 49:109-120

2. Alternatives to regulation considered:

The Northeast Region has implemented more restrictive hunting regulations to address declining moose populations, but these have not generated the expected change.

Alternatives considered:

- Current regulation structure – moose populations have been declining for over 20 years. The current regulations have been inadequate to stabilize the populations.
 - The calf recruitment is low across the Region and is inadequate to stabilize the population. The main driver behind low calf recruitment and survival is predation. Increasing the wolf bag limit to 10 has been proposed and not supported since licenced hunters currently can harvest 3 wolves annually and few hunters consistently harvest wolves. Increasing the limit is unlikely to have a direct, consistent, and sustainable benefit for moose.
 - Implementing a predator control program in specific Game Management Zones to enhance calf moose survival. The Management Plan for Grey Wolf (*Canis lupus*) in British Columbia is clear (section 7.4) that implementing predator control to enhance ungulate populations for hunting is contrary to policy. Licenced hunting opportunities will need to be closed before this alternative can be considered.
-

3. Pros/Cons analysis undertaken & results:

Pros:

- Low calf recruitment indicates moose declines are likely to continue, LEH provides the ability to collect hunter success data and adjust LEH authorizations and quota before the maximum harvest declines below current harvest levels.
- First Nations requested the Province management moose under LEH; this is responsive to their requests
- Responds to First Nations' local and traditional knowledge regarding moose populations
- The Province will need to explicitly consider First Nation Treaty 8 right to hunt when making quota and LEH decisions
- The Province would be able to distribute harvest across the region and reduce the risk of localized overharvesting
- Regional staff and Branch have more control over moose harvest and can adjust LEH authorizations to support management objectives
- Precautionary approach for management units without current inventory data to reduce risk of moose becoming a species of conservation concern

Cons:

- LEH is unlikely to stabilize or increase the moose populations without addressing habitat and predation
 - Licenced hunting community harvests moose for food. A moose provides approximately 200kg of meat for the cost of a hunting licence (\$32) and species licence (\$25). There are additional, variable costs associated with hunting – fuel, travel, accommodations, cut & wrap – that are harder to incorporate since this varies between hunters. Replacing 220kg of moose meat with 220kg of beef would cost approximately \$3,370³ using beef's 2020 weighted average of \$15.31/kg.
 - Licenced hunters may be upset on the reduced opportunity.
 - Northeast licenced hunters will have reduced opportunity under the current LEH system
 - Updating the licencing system to include the new LEH codes will take time and resources
 - Additional staff time to calculate annual LEH and quota recommendations
 - First Nations may expect this change will stop or reverse moose population declines
 - Decreased number of hunters traveling from other Regions to the Northeast for moose hunting
 - Increased harvest pressure in the other Regions that have moose general open season
 - Reducing moose harvest could impact caribou recovery efforts
-

4. Identify risks of NOT implementing the new provision:

The risks associated with not implementing the regulation change could be the non-recoverable collapse of the moose population within the Peace Region. If the general open season continues to operate, the moose population may decrease past a recoverable population. Alternatively, it could lead to a recoverable population, that would require either a LEH or a closed season to allow the population to recuperate. This would also frustrate hunters and stakeholders.

If the government does not listen to the Traditional Knowledge of the local First Nations, there may be a potential violation of Treaty 8 rights, as the population of moose continues to decrease, and sustenance harvest is affected, a lawsuit may be initiated.

5. Comments by Reviewers: *(if relevant)*

Use separate page, as comments may not be included in the final OIC/MO Package.

Copies of email correspondence may be attached.

PART D: STAKEHOLDER CONSULTATION

ADEQUATE CONSULTATION AND ENGAGEMENT MUST BE RECORDED, OR THE FORM WILL BE RETURNED TO THE ORIGINATOR.

Please attach supporting documentation, such as letters, meeting minutes, etc.

Identify who was consulted and when consultations took place.

Who raised concerns and what was the nature of their concerns?

Has the regulation been changed to respond to Stakeholders' Concerns?

| Organization | Contact Name | Date and type of Consultation & Engagement | Supported? (If no, attach an explanation) N/A = Proposal not applicable to organization |
|---------------|--------------|--|---|
| CO Service | | | <input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A Note: CO service consultation is required BEFORE submission is sent to Wildlife & Habitat Branch. Only rarely is this consultation not required. COS verification is required for safety related regulation proposals. |
| Other Regions | | | <input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A |

| | | | |
|---|-------------|--|--|
| Wildlife & Habitat Branch (Victoria) Note: If proposed regulation is for a CITES species, Stephen MacIver (Management Authority for CITES) must be consulted. | Holger Bohm | May 4, 2021 - Discussed proposal and methodology | <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A Note: Consultation is required BEFORE submission is sent to Wildlife & Habitat Branch. Only rarely is this consultation not required. Consultation for: Ungulates: Holger.Bohm@gov.bc.ca Birds: Gerad.Hales@gov.bc.ca Wildlife Health: Caeley.Thacker@gov.bc.ca Furbearers/small game: Gerad.Hales@gov.bc.ca Large Carnivores: Garth.Mowat@gov.bc.ca Motor Vehicle Prohibitions: Depends on the purpose of the closure, if the purpose is related to a specific species contact the species specialist above. Habitat related proposals: Steve.Gordon@gov.bc.ca . |

| Public Meetings: | (attendees) | | <input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A |

PART E: INDIGENOUS CONSULTATION AND ENGAGEMENT

Please attach supporting documentation, such as letters, meeting minutes, etc.

When did initial consultation and engagement period begin? _____

| | |
|--|--|
| a) Does this proposed change have implications (impact or of interest to) Indigenous Peoples? | <input type="checkbox"/> NO - If no, please explain _____ <input type="checkbox"/> YES - If yes, please complete items (b) to (e) if applicable _____ |
| b) Does this proposed change relate to the Calls to Action of the Truth and Reconciliation Commission? | <input type="checkbox"/> NO <input type="checkbox"/> YES - If yes, please indicate which of the calls and how _____ |

| | |
|---|--|
| <p>c) Does this proposed change relate to any of the following legal or other government obligations?</p> <ul style="list-style-type: none"> • modern treaty obligations to notify, discuss or consult, • common law consultation obligations, • contractual commitments, • under the <i>Declaration on the Rights of Indigenous Peoples Act</i>? | <p><input type="checkbox"/> NO</p> <p><input type="checkbox"/> YES – If yes, please explain how</p> <hr/> <p>Please review the following to help you with your analysis: ILR Reference Document: Indigenous Legal Relations Review of Cabinet Submissions*; UN Declaration Reference Document*; Provincial Legislation Engagement with Treaty Nations Guide</p> <p>*Note: You may have to request permission to the site from the Ministry of Attorney General.</p> |
| <p>d) Does this proposed change affect Indigenous peoples' modern or historic treaty rights or Aboriginal rights, including any Aboriginal title?</p> | <p><input type="checkbox"/> NO</p> <p><input type="checkbox"/> YES – If yes, please indicate how.</p> <p>Was the consultation sufficient for the purposes of the constitutional obligations?</p> <hr/> |
| <p>e) Have Indigenous peoples, including Indigenous organizations, been involved in the development of the proposed change, and will they be involved in its implementation?</p> | <p><input type="checkbox"/> NO - If no, please explain why not</p> <hr/> <p><input type="checkbox"/> YES - If yes, what views were expressed or how will they be sought?</p> <hr/> <p>Please review the Policy Framework for Advancing Reconciliation with Indigenous Peoples for guidance on involving Indigenous peoples in your policy development.</p> <p>If you would like further support with this section, please contact Legislative Alignment and Process.</p> |

Indigenous Peoples

We require the name of each Indigenous group engaged and individuals within the group. When did the engagement and consultation take place and in what forum (letter, fax, meeting, etc.)? What was the response or outcome of engagement (band by band or tribal association)? What might be the anticipated impact of this proposal on the Indigenous peoples ability to practice their Aboriginal Interests?

If consultation/engagement with Indigenous peoples is incomplete/ongoing indicate the anticipated completion date.

PART F: APPROVAL

**RECORD OF APPROVALS FOR REGULATION CHANGES
UNDER THE *WILDLIFE ACT***
